SOCIETY RECORDS—Part III

(Including Indexes to Publications)

[*Part I of Society Records for the year 1941 (containing Council and Committee Personnel and other general information) was issued as Section Two of the Transactions for February, 1941, and Part II (Memorial Biographies) October, 1941.*]

JANUARY, 1942

VOL. 64, NO. 1

Transactions

of The American Society of Mechanical Engineers

Published on the tenth of every month, except March, June, September, and December

---

Published monthly by The American Society of Mechanical Engineers. Publication office at 20th and Northampton Streets, Easton, Pa. The editorial department located at the headquarters of the Society, 29 West Thirty-Ninth Street, New York, N. Y. Cable address, "Dynamic," New York. Price $1.50 a copy, $12.00 a year; to members and affiliates, $1.00 a copy, $7.50 a year. Changes of address must be received at Society headquarters two weeks before they are to be effective on the mailing list. Please send old as well as new address.... By-Law: The Society shall not be responsible for statements or opinions advanced in papers or ... printed in its publications (B13, Par. 4).... Entered as second-class matter March 2, 1928, at the Post Office at Easton, Pa., under the Act of August 24, 1912....

Depositories for A.S.M.E. Transactions in the United States, Including Territories and Dependencies

BOUND copies of the complete Transactions of The American Society of Mechanical Engineers will be found in the libraries in the United States and other countries which are listed on the following pages.

Alabama

Auburn..........Engineering Library, Alabama Poly. Inst.
Birmingham.....Public Library
University.......Library, University of Alabama

Arizona

Tucson..........Library, University of Arizona

Arkansas

Fayetteville......Engineering Library, University of Arkansas

California

Berkeley.........Library, University of California
Long Beach......Public Library
Los Angeles......Public Library
University of Southern California
Oakland.........Oakland City Library
Teachers' Professional Library

Indexes to A.S.M.E. Papers and Publications

THIS and the following pages will serve as a guide to the current publications of the A.S.M.E. during the calendar year 1941, and also to publications developed by technical committees.

Regular Society Publications, 1941

Mechanical Engineering, monthly (see index on page RI-93)
A.S.M.E. Transactions, monthly (see index on page RI-105)
Mechanical Catalog and Directory, 1942 edition

Special Publications Issued in 1941

Biography of Fred J. Miller
1940 Oil Engine Power Cost Report
1941 Proceedings of the Oil and Gas Power Division
Sixty-Year Index

American Standards

Abbreviations for Scientific and Engineering Terms
Cast Iron Screwed Fittings
Graphical Symbols for Use on Drawings in Mechanical Engineering
Jig Bushings
Preferred Thickness for Uncoated Thin Flat Metals
Safety Code for Jacks
Soldered-Joint Fittings
T-Slots, Their Bolts, Nuts, Tongues, and Cutters
Wrench-Head Bolts and Nuts and Wrench Openings

Boiler Construction Code

Welding Qualifications (Section 9)
1941 Addenda to:
  Locomotive Boiler Code
  Miniature Boiler Code
  Power Boiler Code
  Unfired Pressure Vessel Code
  Specifications for Materials

Power Test Codes

Dust Separating Apparatus
Evaporating Apparatus
Steam Locomotives
Steam Turbines

Auxiliary Sections

Part 2, Pressure Measurement, Chapters 1 and 6
Part 8, Measurement of Indicated Horsepower

How to Find Papers Presented at 1941 A.S.M.E. Meetings

THE technical programs of the meetings of the Society and of its Professional Divisions have been published in *Mechanical Engineering* and may be located by consulting the index on pages RI-93-103. A majority of these papers were published, or will be published, in *Mechanical Engineering* or the Transactions (including the *Journal of Applied Mechanics*) and may be located by reference to the indexes of these publications. Several additional papers and reports included in these 1941 programs were not published during the year in Transactions or *Mechanical Engineering*, but were issued in mimeographed or photo-offset form.

Complete sets of these are on file for reference purposes at the office of the Society and the Engineering Societies Library, under the title of "Miscellaneous Papers Presented at A.S.M.E. Meetings, 1941." Photostat copies of any of the papers may be secured from the Library at twenty-five cents a page to members, or thirty cents a page to nonmembers.

Publications Developed by the Technical Committees

THE Society's technical committees, the first of which was organized many years ago and all of which have been continuously at work on codes, standards, research, and other special reports, have developed a series of publications of permanent value to the membership. The following list is presented here for record and for ready reference. This list covers the entire group of publications of these committees completed to date which are now available.

To assist the members in securing copies of these publications the sale price is also given. A discount of 10 per cent is allowed to A.S.M.E. members on standards and a 20 per cent discount on all other publications except where otherwise noted.

A.S.M.E. AMERICAN STANDARDS

Bolt, Nut, and Rivet Proportions

Large Rivets (B18.4—1937), $0.65
Plow Bolts (B18f—1928), $0.35
Round Unslotted-Head Bolts (B18.5—1939), $0.50
Slotted-Head Proportions: Machine Screws, Cap Screws, and Wood Screws (B18c—1930), $0.45
Small Rivets (B18a—1927), $0.30
Socket Set Screws and Socket-Head Cap Screws (B18.3—1936), $0.40
Tinners', Coopers', and Belt Rivets (B18g—1929), $0.35
Track Bolts and Nuts (B18d—1930), $0.40
Wrench-Head Bolts and Nuts and Wrench Openings (B18.2—1941), $0.65

Piping and Pipe Fittings

Brass Fittings for Flared Copper Tubes (A40.2—1936), $0.35
Cast-Iron Pipe Flanges and Flanged Fittings for 25 Lb Maximum Saturated Steam Pressure (B16b2—1931), $0.40
Cast-Iron Pipe Flanges and Flanged Fittings for 125 Lb Maximum Saturated Steam Pressure (B16a—1939), $0.60
Cast-Iron Pipe Flanges and Flanged Fittings for 250 Lb Maximum Saturated Steam Pressure (B16b—1928), $0.50
Cast-Iron Pipe Flanges and Flanged Fittings for 800 Lb Maximum Hydraulic Pressure (B16b1—1931), $0.35
Cast-Iron Soil Pipe and Fittings (A40.1—1935), $0.65
Cast-Iron Long Turn Sprinkler Fittings for 150 and 250 Lb Maximum Saturated Steam Pressure (B16g—1929) and Addendum (B16g1—1937), $0.50
Cast-Iron Screwed Fittings for 125 and 250 Lb Maximum Saturated Steam Pressure (B16d—1941), $0.40
Code for Pressure Piping (B31.1—1935), $1.00
Face-to-Face Dimensions of Ferrous Flanged and Welding End Valves (B16.10—1939), $0.55
Malleable-Iron Screwed Fittings for 150 Lb Maximum Saturated Steam Pressure (B16c—1939), $0.50
Pipe Plugs (B16e2—1936), $0.35
Scheme for the Identification of Piping Systems (A13—1928), $0.50

Steel Pipe Flanges and Flanged Fittings for 150 to 2500 Lb Maximum Steam Service Pressure (B16e—1939), $1.25
Soldered-Joint Fittings (A40.3—1941), $0.45
Steel Butt-Welding Fittings (B16.9—1940), $0.40
Wrought-Iron and Wrought-Steel Pipe (B36.10—1939), $0.50

Letter and Graphical Symbols and Charts

Abbreviations for Scientific and Engineering Terms (Z10.1—1941), $0.35
Aeronautical Symbols (Z10e—1929), $0.35
Drawings and Drafting-Room Practice (Z14.1—1935), $0.50
Engineering and Scientific Charts for Lantern Slides (Z15.1—1932), $0.50
Graphical Symbols for Electric Power and Wiring (Z10g2—1933), $0.20
Graphical Symbols for Electrical Traction Including Railway Signaling (Z10g5—1933), $0.40
Graphical Symbols for use on Drawings in Mechanical Engineering (Z32.2—1941), $0.50
Graphical Symbols for Radio (Z10g3—1933), $0.20
Graphical Symbols for Telephone and Telegraph Use (Z10g6—1929), $0.20
Letter Symbols for Electrical Quantities (Z10g1—1929), $0.20
Symbols for Electrical Equipment of Buildings (C10—1924), $0.20
Symbols for Heat and Thermodynamics (Z10c—1931), $0.30
Symbols for Photometry and Illumination (Z10d—1930), $0.20
Time Series Charts (Z15.2—1938), $1.25

MISCELLANY

Fire-Hose Coupling Screw Thread (B26—1925), $0.25
Production and Inspection of Fire-Hose Coupling Screw Thread (1925), $0.25
Gear Materials and Blanks (B6.2—1933), $0.50
Hose Coupling Screw Threads (B33.1—1935), $0.25
Indicating Pressure and Vacuum Gages (B40—1939), $0.40
Preferred Thickness for Uncoated Thin Flat Metals (B32.1—1941), $0.25
Rolled Threads for Screw Shells of Electric Sockets and Lamp Bases (C44—1931), $0.35
Shaft Couplings (B49—1932), $0.35
Spur Gear Tooth Form (B6.1—1932), $0.45

Small Tools and Machine Tool Elements

Machine Tapers (B5.10—1937), $0.50
Milling Cutters (B5c—1930), $0.75
Taps—Cut and Ground Threads (B5.4—1939), $1.25
Terminology and Definitions for Single-Point Cutting Tools (B5.13—1939), $0.40
Adjustable Adapters (B5.11—1937), $0.50
Chucks and Chuck Jaws (B5.8—1936), $0.45
Circular and Dovetail Forming Tool Blanks (B5.7—1936), $0.40
Involute Splines, Side Bearings (B5.15—1939), $0.65
Jig Bushings (B5.6—1935), $0.35
Lathe Spindle Noses (B5.9—1936), $0.50
Reamers (B5.14—1941), $0.75
Rotating Air Cylinders and Adapters (B5.5—1932), $0.35
Tool Holder Shanks—Tool Post Openings (B5b—1929), $0.25
T-Slots, Their Bolts, Nuts, Tongues, and Cutters (B5a—1941), $0.35
Twist Drills (B5.12—1940), $0.55
Ball and Roller Bearings (B3.1, 2, 3—1930–1933), $0.40
Code for Design of Transmission Shafting (B17c—1927), $0.75
Shafting and Stock Keys (B17.1—1934), $0.45
Screw Threads for Bolts, Nuts, Machine Screws, and Threaded Parts (B1.1—1935), $0.60
Screw Thread Gages and Gaging (B1.2—1941), $0.60
Acme and Other Translating Threads (B1.3—1941), $0.45
Tolerances, Allowances, and Gages for Metal Fits (B4a—1925), $0.50
Woodruff Keys, Keyslots, and Cutters (B17f—1930), $0.35

BOILER CONSTRUCTION CODE

1941 Addenda to:
- Locomotive Boiler Code, $0.15
- Miniature Boiler Code, $0.15
- Power Boiler Code, $0.55
- Unfired Pressure Vessel Code, $0.55
- Specifications for Materials, $0.85

Welding Qualifications, $0.65
Boiler Code Interpretation Service, $5.00 annually

JOINT CODE

API-ASME Code for Unfired Pressure Vessels for Petroleum Liquids and Gases (1938 with 1940 Addenda), $1.25

POWER TEST CODES AND AUXILIARY SECTIONS

Test Codes for

Atmospheric Water-Cooling Equipment (1930), $0.45
Compressors and Exhausters (1935), $0.95
Displacement Compressors, Vacuum Pumps, and Blowers (1939), $0.75.
Dust Separating Apparatus (1941), $0.90
Evaporating Apparatus (1941), $0.50
Feedwater Heaters (1927), $0.35
Gas Producers (1928), $0.55
Hydraulic Prime Movers (1938), $0.60
Internal-Combustion Engines (1930), $0.55
Liquid Fuels (1930), $0.35
Reciprocating Steam Engines (1935), $0.65
Reciprocating Steam-Driven Displacement Pumps (1927), $0.65
Refrigerating Systems (1927), $0.55
Solid Fuels (1931), $0.55
Speed-Responsive Governors (1927), $0.45
Stationary Steam-Generating Units (1936), $0.60
Steam Condensing Apparatus (1938), $0.65
Steam Locomotives (1941), $0.55
Steam Turbines (1941), $2.50

Auxiliary Sections

Part 1—General Consideration (1935), $0.35
Part 2—Pressure Measurement; Chapter 1, Barometers; Chapter 6, Tables, Multipliers, and Standards (1941), $0.60
Part 2—Pressure Measurement; Chapter 2, Static and Total Pressure, Static Holes and Tubes, Impact Tubes, and Chapter 3, Pipes for Pressure Measurement (1936), $0.65
Part 2—Pressure Measurement; Chapter 4, Bourdon, Bellows, Diaphragm, and Deadweight Gages (1938), $0.65
Part 3—Temperature Measurement; Chapter 1, General; Chapter 5, Pyrometric Cones; Chapter 6, Liquid-in-Glass Thermometers; and Chapter 7, Bourdon Tube Thermometers (1931), $0.75
Part 3—Temperature Measurement; Chapter 2, Radiation Pyrometers (1936), $0.55
Part 3—Temperature Measurement; Chapter 3, Thermocouple Thermometers or Pyrometers (1940), $0.65
Part 3—Temperature Measurement; Chapter 8, Optical Pyrometers (1940), $0.35
Part 4—Head Measuring Apparatus (1933), $0.35
Part 5, Chapter 4—Flow Measurement by Means of Standardized Nozzles and Orifice Plates (1940), $2.75
Part 6—Electrical Measurements (1934), $1.25
Part 8—Measurement of Indicated Horsepower (1941), $0.75
Part 9—Heat of Combustion (1932), $0.40
Part 10—Flue and Exhaust Gas Analyses (1936), $1.35
Part 11—Determination of Quality of Steam (1931), $0.45
Part 13—Speed Measurements (1939), $0.45
Part 14—Linear Measurements (1936), $0.55
Part 15—Measurement of Surface Areas (1937), $0.75
Part 16—Density Determinations (1931), $0.30
Part 17—Determination of the Viscosity of Liquids (1931), $0.45
Part 18—Humidity Determinations (1932), $0.50
Part 20—Smoke-Density Determinations (1936), $0.65

RESEARCH

Dynamic Loads on Gear Teeth (1932), $1.50
Fluid Meters:
- Part 1—Theory and Application (1937), $3.00
- Part 2—Description of Meters (1931), $1.75
- Part 3—Selection and Installation (1933), $1.50

Report of the AGA-ASME Committee on Orifice Coefficients (1935), $2.75
Tests on Electrical Equipment for Drilling Rotary Drilled Oil Wells (1933), $0.85
Tests on Steam Equipment for Drilling Rotary Drilled Oil Wells (1932), $0.85
Bibliography on Cutting of Metals (1866–1930), $1.25
Bibliography on Deterioration of Condensing Equipment (1845–1930), $1.25
Bibliography on Effect of Temperature Upon Properties of Metals (1928–1931), $1.25

Bibliography on Management Literature and Supplement (1903–1935), $2.75
Bibliography on Mechanical Springs (1678–1927), $1.25
Bibliography on Woods of the World (1928), $1.25
Bibliography on Marketing Research (1935), $1.00
Bibliography on Machining of Wood (1939), $1.25

SAFETY CODES

Safety Code for Elevators (A17.1—1937) (10 per cent discount), $1.00
Elevator Inspectors' Manual (A17.2—1937) (10 per cent discount), $0.75
Safety Code for Jacks (B30—1941), $0.30
Safety Code for Mechanical Power-Transmission Apparatus (10 per cent discount) (B15—1927), $0.35
Compressed-Air Machinery and Equipment (B19—1938), $0.30

BIOGRAPHIES

BIOGRAPHIES issued under the sponsorship of the A.S.M.E. Biography Committee are as follows:

Autobiography of John A. Brashear (1924), $5.00
Autobiography of an Engineer, by W. LeR. Emmet (1940), $3.50
Autobiography of John Fritz (1940), $3.25
Biography of James Hartness, by Joseph W. Roe (1937), $4.00
Biography of Fred J. Miller (1941), $1.00
Biography of John Stevens, by Archibald Douglas Turnbull (1928), $5.00
Biography of John Edson Sweet, by A. W. Smith (1925), $4.50
Biography of Robert Henry Thurston, by William F. Durand (1929), $5.00
Life of Henry Laurence Gantt, by L. P. Alford (1934), $5.00

BOOKS ON SPECIAL SUBJECTS

Aeronautical Dictionary (1929), $1.65
Corrosion-Resistant Metals (1936), $1.25
Engineering's Part in the Development of Civilization (1939), $1.50
Flow of Water in Pipes and Pipe Fittings (1941), $8.00
General Discussion on Lubrication (1938) (no discount), $6.50
Hydraulic Laboratory Practice (1929), $10.00
Hydraulic Structures (1937), $18.00
Manual on Cutting of Metals (1939), $5.00
1942 A.S.M.E. Mechanical Catalog and Directory, $3.00 (sent gratis to members, upon request)
1940 Oil Engine Power Cost Report (1940), $1.00
Sixty Year Index to A.S.M.E. Technical Papers (1941), $3.75
Theoretical Steam Rate Tables (1937), $1.25

Combustion of Four Fuels in One Boiler

By W. J. LUTZ,[1] NEWARK, N. J.

Present-day fuel economics has decreed the desirability of a multifuel-burning boiler even in small and medium-sized installations. This paper describes the 100,000-lb per hr four-fuel boiler in the Harrison Gas Works of the Public Service Electric and Gas Company at Harrison, N. J. The difficulties encountered in burning oil, tar, pulverized coal, and pulverized fuel-pitch in the same burner and their successful solution are reported in detail.

GENERALLY speaking, the controlling factor in the design of a steam-generating unit is the selected fuel. In some instances, considerations of economics, of sources of supply, or of owner policies narrow the choice of fuels down to one particular type. In such cases, the boiler is designed to burn that one fuel as efficiently as possible. In other instances, the plant management has a choice of a number of available fuels not too far out of line economically. The fuel which may be selected today, however, may not be the first choice a year or even a few months from now when the economic picture has changed. Yet, it is necessary to make a decision. This problem of fuel selection is independent of the size of the plant, whether it be small, medium-sized, or a superpower station.

With price changes in the fuel market, it has often been advantageous to revamp boilers so as to burn the currently cheaper fuel. Another price swing might still later cause a return to the original fuel. Such cases are not uncommon, especially in the eastern-seaboard area where shifts in the relative prices of oil and coal have been pronounced.

In locations where competitive fuels are available, the experience of the last decade has definitely dictated the need of a universal boiler which can handle a number of fuels equally well without requiring extensive and costly alterations with each change of fuel. In fact, the change should be made from one fuel to another without even shutting down. Such a unit would permit the operator to select the most economical fuel and would extend the sources of his fuel supply.

The need for a universal burner and boiler became apparent in 1937 at the Harrison Gas Works of the Public Service Electric and Gas Company, Harrison, N. J., when plans were being made to extend the boiler plant, for there were available four fuels, i.e., oil, coal, tar, and fuel-pitch.

There were on the market at that time boilers of the integral-furnace type, successfully handling oil, pulverized coal, and gas, which seemed to meet the requirements of a universal boiler for small and medium-sized installations. There were also available successful combination oil-and-pulverized-coal burners. A two-fuel boiler was an established fact and was offered as a standard product by several leading boiler manufacturers. To add two more fuels, tar and pulverized fuel-pitch, thereby approaching more nearly to a hypothetical universal burner, was the particular problem put to the boiler manufacturers. It was further stipulated that all fuels must be as successfully burned as if the boiler and burner were designed for that particular fuel alone. It was to be a four-fuel combination burner and not a compromise burner.

Prior to this plant extension, the boiler equipment in this 40,000-Mcf per day carbureted water-gas plant at Harrison, N. J., consisted of four 50,000-lb per hr units with chain-grate stokers, firing river barley and coke breeze, and eight waste-heat boilers. Increased load and a desire for greater fuel flexibility were the motivating factors for the installation of a 100,000-lb per hr unit capable of handling four fuels, oil, tar, pulverized coal, and fuel-pitch.

New Unit at Harrison

The new unit is a standard Babcock & Wilcox integral-furnace boiler of the general arrangement shown in Figs. 1 and 2. It is designed to deliver 100,000 lb of steam per hr at 230 psi gage and 500 F total temperature.

When contracting to furnish a four-fuel boiler, the manufacturer was aware of the characteristics of pulverized fuel-pitch and had already concluded that the conventional circular pulverized-coal burner, which depended upon impellers and splash plates to obtain good distribution and turbulence of the primary air and pulverized fuel, would be unsatisfactory, for the pitch would adhere to the impeller or splash plate and eventually result in a stoppage.

Fuel-Pitch

Fuel-pitch is a by-product of water-gas or coal-gas tar. It is the solid residue of the distillation of these tars at about 800 F, which can either be flaked or broken into lumps that can be crushed to any size in an ordinary crusher. When flaked it consists of small, irregular, fragile, shiny black flat chips about $^1/_{16}$ in. thick and $^1/_2$ in. across. When handled in lumps, it is not unlike soft coal, porous and dirty.

To minimize the dust, when handling flaked pitch, bunker C oil in quantities of about 0.3 gal per net ton is sprayed on it. Water is unsatisfactory as the shiny flaked particles are water-repellent. When handling it in crushed lump form, water is added during the dry season in amounts to bring the surface moisture up to about 2 or 3 per cent by weight.

In either form, fuel-pitch has a softening temperature of 300 to 330 F, as determined by the $^1/_2$-in. cube-in-air test. It becomes tacky at about 190 to 200 F. The temperature rise resulting from the frictional impact of pulverized pitch against an impeller or splash plate would be sufficient to cause a building up of pitch. It is apparent that the mixing of pulverized pitch with the primary air must be done without impellers or splash plates or other devices which would cause too sudden a change in the velocity of the pitch particles, thereby transferring kinetic energy into heat energy.

New Babcock & Wilcox Burner

The Babcock & Wilcox Company were experimenting at that time with a new pulverized-coal burner in which the primary air and pulverized fuel are led through a volute-shaped burner casing and discharged axially into the primary-fuel pipe. The secondary air is similarly led through a volute-shaped burner casing and discharged axially into the secondary-air pipe concentric with and surrounding the primary-fuel pipe. The directional whirl of the secondary air is governed by the direction of the volute-shaped burner entrance and is opposite to that of the pulverized fuel. Thus when the primary air carrying the fuel and the

secondary air meet at the burner exit the two are moving at high velocity and at right angles to each other. To assist in ignition and in the burning of high-volatile coals, atmospheric air can be drawn into the center of the primary-air fuel pipe through a short tertiary-air nozzle. Fig. 3 shows the essential features of this pulverized-coal burner, which somewhat resembles two superimposed fan casings on a common axis. The direction of flow, however, is from the periphery to the center, the reverse of that in a fan.

Results when firing pulverized coal at another plant justified the claims that good distribution and turbulence could be obtained by use of a volute casing and, hence, offered possibilities for firing pulverized fuel-pitch. It was, of course, realized by the manufacturer that this design had only been tried as a single-fuel burner. Its possibilities as a combination burner, even with such standard fuels as pulverized coal and oil, were still undetermined. The purchaser, too, realized that the introduction of fuel-pitch, especially in a combination four-fuel burner, added problems the solution of which could only be worked out cooperatively in the field.

Fig. 4 shows the combination burner as originally furnished. The assembly consists of three concentrically arranged volute-shaped casings and a liquid-fuel-burner pipe at the center. When firing pulverized coal, the coal is mixed with tempered air at the pulverizer in the basement and delivered through the intermediate pipe. Secondary air delivered by a forced-draft fan is forced through a Ljungström air preheater located on top of the

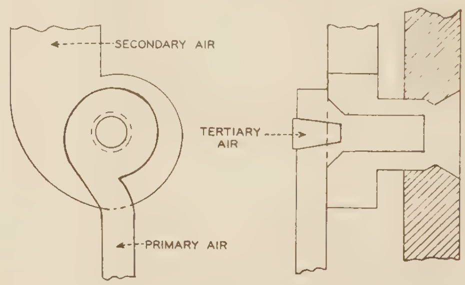

Fig. 3 New Babcock & Wilcox Pulverized-Coal Burner

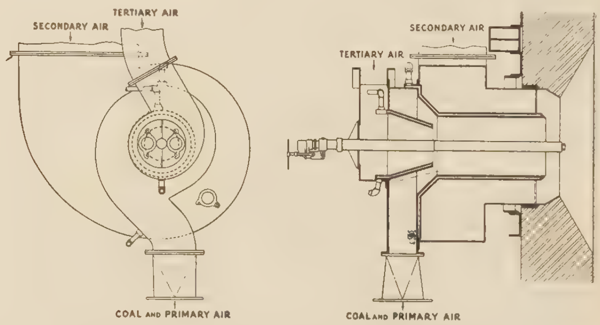

Fig. 4 Original Combination Four-Fuel Burner

boiler and then down to the burner through the inner and largest duct. The direction of the secondary-air-casing volute is opposite to that of the primary air. Control of the secondary air is obtained indirectly by first changing the speed of the turbine-driven induced-draft fan which changes the furnace draft. In turn the forced-draft fan changes speed accordingly to maintain a predetermined constant furnace draft.

When firing liquid fuels, as oil or tar, the entire combustion air, except a very small amount of tertiary air for ignition purposes, is supplied through the secondary-air duct.

When firing pulverized fuel-pitch only cold primary air is used. It was believed necessary to use cold tertiary air under pressure to aid in the combustion of high-volatile fuel-pitch. This air is led into the center of the primary-air stream with a directional whirl opposite it. The primary-fuel-burner pipe is also water-

cooled to prevent pitch from approaching the tacky temperature of about 190 to 200 F before it reaches the burner tip.

Oil Firing

The boiler was first fired with oil and it was observed in this preliminary run that the whirl obtained in the secondary-air scroll was too great. The air left the burner throat at the periphery at too high a velocity, thereby resulting in but slight mixing with the oil spray. The flame was flat, pancake-shaped, hollow, and smoky in the center.

To slow down the secondary-air whirl to a point where the oil and air could mix properly, stationary air-guide vanes were installed in the annular secondary-air throat. Their value became apparent in subsequent trial runs, though it was necessary to change their setting and to alter the plastic burner throat from a 60-deg throat to a 30-deg throat, as well as to make several changes in the design of the sprayer plates, before the desired whirling, full-bodied, short, white-tipped flame was procured.

The oil burner is the standard Babcock & Wilcox mechanical-steam-atomizing unit, Figs. 5 and 6, external-mix type which

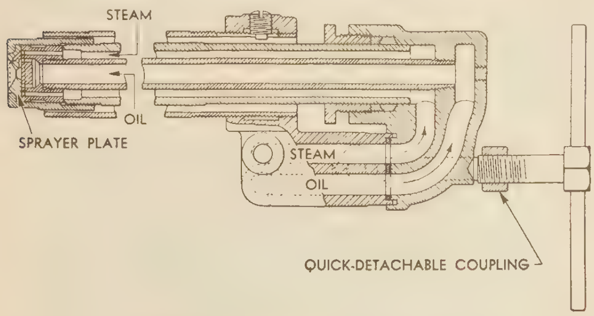

Fig. 5 Babcock & Wilcox Steam Mechanical Atomizing Burner for Oil Firing

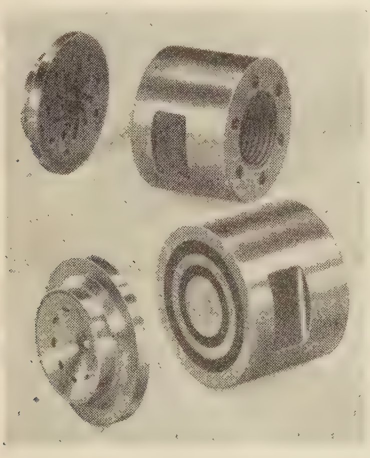

Fig. 6 Babcock & Wilcox Steam Mechanical Atomizing Sprayer Plate

operates as a steam-atomizing unit when the oil pressure is below 100 psi, and can be operated as a mechanical sprayer at pressures above that. The manufacturer definitely recommended the mechanical-steam type rather than a straight mechanical type for use in the "cold" or completely water-cooled furnace.

Pulverized-Coal Firing

Trial runs with pulverized coal disclosed that the secondary-air velocity was too high to burn even high-volatile coal. To reduce it, the diameter of the secondary-air throat was increased by cutting down the venturi lip on the outside of the throat. This lip was also streamlined in order to reduce the vena contracta and to secure full effective area of the throat. Observations of the secondary-air flow from the furnace side with pitot tubes when the boiler was cold indicated a uniform velocity and a good directional whirl. Subsequent runs with pulverized-coal firing showed a marked improvement, though it was necessary to change the angle of the stationary vanes about 10 deg from that found satisfactory for oil firing before the desired compact full-bodied pulverized-coal flame was obtained.

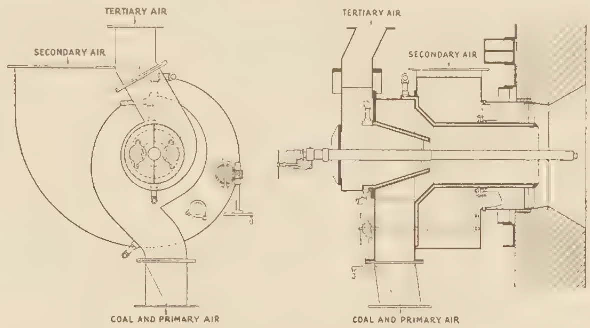

Fig. 7 Intermediate Development Stage of Combination Four-Fuel Burner

Upon operating the unit again on oil, it was found that the oil flame was unsatisfactory. Apparently, the changes in the combination burner necessitated to burn pulverized coal had seriously affected the successful oil firing. The vane angle was changed back to the original, and once more satisfactory oil-firing results were secured. Several rechecks on coal- and oil-burner operation showed that there appeared to be no one fixed secondary-air-vane setting for even this type of burner which would be satisfactory for pulverized-coal and oil firing and, since this burner had to burn pulverized fuel-pitch as well, there remained only one answer—install adjustable secondary-air vanes.

Upon completion of the installation of the adjustable secondary-air vanes, the burner appeared as shown in Fig. 7. To summarize, a comparison with the original shows the following changes:

1 A 30-deg plastic throat instead of the 60-deg throat.

2 A streamlined metal lip in place of the original sharp venturi.

3 The installation of adjustable guide vanes in the secondary-air throat.

Trial runs when firing either oil or pulverized coal proved the value of adjustable vanes, and a series of performance tests with these two fuels was conducted, before starting trial runs with tar and pulverized fuel-pitch. The results of these tests indicated the general attainment of the guaranteed test efficiencies of 87 per cent and over-all performance when firing these fuels.

Tar Firing

Little trouble was expected from tar firing in this combination burner, for the major problem of tar firing is one of conditioning the tar for proper handling and atomization. The Saybolt Furol viscosity of water-gas tar at 122 F (50 C) ranges from 400 to 2000 sec or, in terms of specific viscosity Engler 50 cc, 176 F (80 C), from 20 to 43. It contains breeze in small amounts and, as delivered to the boilerhouse at the Harrison plant, it has a water content of about 0.5 per cent. Tar-firing operations can

be grouped into (1) storage and pumping, (2) heating, and (3) atomization and combustion.

Due to its high viscosity, tar is stored in insulated, heated supply tanks at about 180 to 200 F. At this temperature, it flows readily to the reciprocating pumps and only slight strainer trouble is encountered. A change of strainers once per shift is

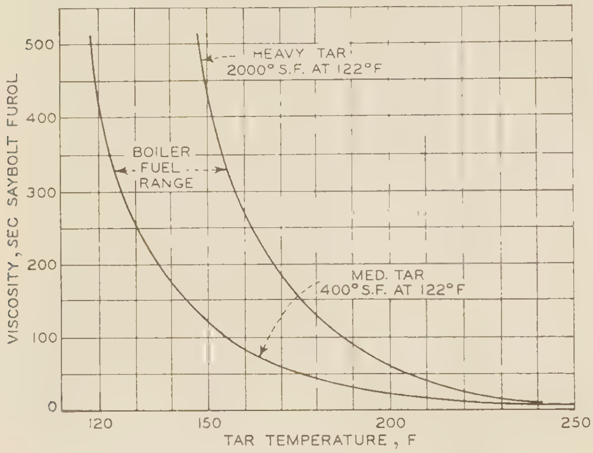

Fig. 8 Tar Temperature-Viscosity Curve

normal. At lower temperatures such as 150 F or less, there is a marked increase in suction-strainer blockage, which is probably due to the presence of the breeze in the tar. The small breeze particles appear to form the nuclei about which the tar coagulates as it cools. At higher temperatures the suspended breeze particles flow freely through $^1/_{16}$-in. round-hole strainers.

The presence of this abrasive breeze in water-gas tar, even in small amounts, precludes the use of any close-clearance pump, such as a gear or screw type, for handling purposes. Reciprocating pumps equipped with alloy-steel liners, of iron, nickel, and copper composition, and stainless-steel valves have to date proved most satisfactory and should have a life equal to that of a pump handling ordinary fuel oil. Centrifugal pumps can also be used, provided a uniform tar-inlet temperature is maintained. The tar-temperature-viscosity curve for temperatures of 150 to 190 F is rather steep in this range, thus, even a 10 or 20 F variation results in a considerable viscosity and, hence, pump delivery change, Fig. 8.

To condition the tar to the desired 18 sec Saybolt Furol or 4 deg Engler at the burner tip requires heaters to bring the temperature up to about 220 to 250 F. No trouble with carbon deposits in the heater has been experienced. A yearly checkup and brushing of the tubes is the present extent of the maintenance.

No combustion troubles have been encountered with tar firing. The flame has the exact appearance of the oil flame. Steam-atomizing burners of the internal-mix type, equipped with sludge sprayer tips, Figs. 9 and 10, are used. Considerable wear in the sprayer plates and nozzles took place. Different materials, such as chrome-nickel alloys and casehardened steel, were tried but did not last 2 weeks. The latest development is a chrome-silicon-alloy tip which to date has shown signs of service measured in terms of months. To increase their life yet further the manufacturer is experimenting with tips which have been casehardened by a new process of nitriding alloy steels. A set will be tried out shortly.

Mechanical atomization of tar can also be used. In fact it may be stated that any bunker C fuel-oil burner, steam-atomizing or mechanical, can successfully handle tar, provided the tar is conditioned to a viscosity equal to that of the oil for which the burner was designed. The presence of breeze in water-gas tar will require the use of abrasive-resisting material for the nozzle.

Steam-atomizing burners are preferred, especially for burners which operate intermittently and in completely water-cooled furnaces. The steam heats up the tar-burner pipe directly to the nozzle tip, thereby securing conditioned tar right at the start. Drooling, poor atomization, and smoke are the usual characteristics of a mechanical burner when starting up with tar.

Unfortunately, the suspended breeze particles in the tar do not burn up in the furnace, although they have a heat content of about 11,000 Btu per lb. They will drop out in the combustion

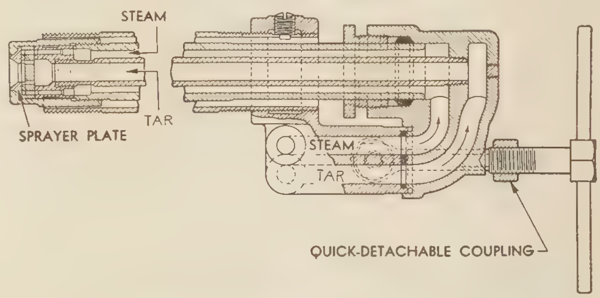

Fig. 9 Babcock & Wilcox Steam-Atomizing Burner for Tar Firing

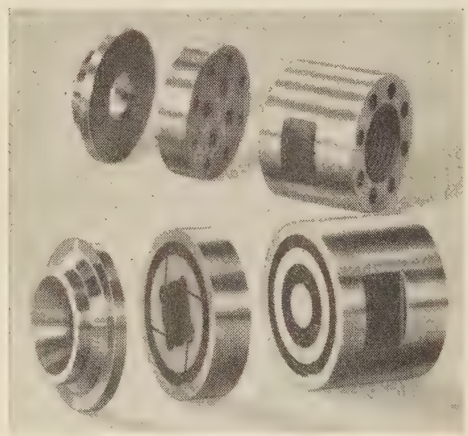

Fig. 10 Babcock & Wilcox Steam-Atomizing Sprayer Plate

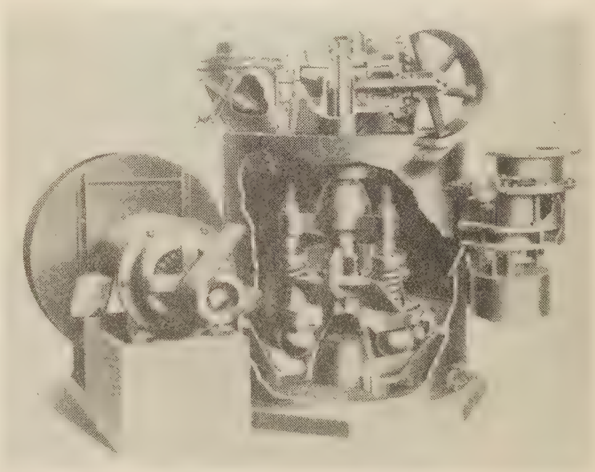

Fig. 11 Babcock & Wilcox Type-B Coal Pulverizer

chamber or pass out into the stack. Their presence, though, has one beneficial effect in that, in passing through the air heater, they keep the heating surfaces absolutely clean. When operating with oil, it is necessary to take the heater out of service every 6 months to wash off the smudge coating which is not effectively removed with everyday soot blowing.

Pulverizing Fuel-Pitch

The next problem in the development of this four-fuel burner was to burn pulverized fuel-pitch, the main function of this burner and the reason for the deviation from the standard burner.

The pulverizing equipment, as originally furnished, consisted of a Babcock & Wilcox type-B ball-race mill with a water-cooled lower race and side-wall jacket to keep the temperature within the mill well below the tacky temperature of 190 F for fuel-pitch. When pulverizing coal no water cooling is used.

The first attempts to pulverize pitch in this ball-race mill, Fig. 11, met with failure. The balls crushed and packed the pitch in the ball race, thereby stopping the balls from rolling, while the upper race simply slid over them. This took place regardless of the spring pressure on the balls. The next move was to increase the primary-air velocity over the lower ball race by reducing the throat opening and the installation of directional baffles within the pulverizer. It was theorized that the higher primary-air velocity would sweep away the finely crushed pitch before packing could take place. This, too, met with failure.

A restudy of these failures led to the suggestion of using smaller balls in the same race. Pitch is very fragile and has a grindability of about 150 Hardgrove scale. Therefore, but little weight and pressure are required. Furthermore, the use of small balls in a race designed for larger balls means the balls have only point contact with the pitch.

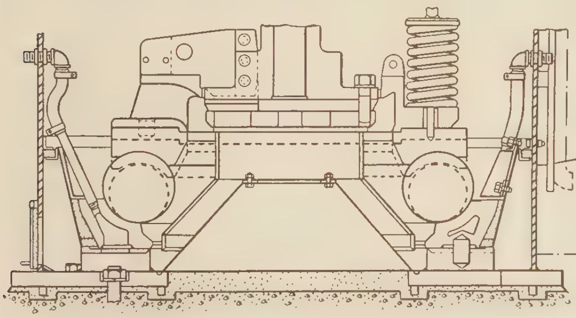

Fig. 12 Pulverizer Ball-Race Detail

There is also ample clearance between the ball and race for the crushed pitch to lie without being packed. The suggestion was put into effect and worked out successfully from the start. Fig. 12 shows this combination in the type-B pulverizer. Samples taken at the pulverizer outlet had a fineness of 92 per cent through 200 mesh.

Pulverized-Fuel-Pitch Firing

Combustion difficulties encountered in burning pulverized pitch were manifold and can be grouped into (*a*) dripping of the plastic pitch at the burner tip, (*b*) flashbacks in the burner, (*c*) poor fuel distribution, and (*d*) burner and pipe blockage. All these accounted in part for the low efficiency. The pulverized-pitch flame is much brighter than the pulverized-coal flame, and has semidistinct end boundaries. Rear-door observations clearly showed the presence of incandescent pitch particles in the bright combustion gases. These particles would shoot through like meteors. They were also descriptively referred to as burning "matchsticks" or as "butterflies." When cooled, these particles dropped out in the combustion chamber or swept beyond into the breeching and stack. Many of the particles had the appearance of small, round, broken Christmas-tree balls, ranging in size from a pin point to a BB shot. Apparently the bottled-up volatile gases within the incandescent plastic-pitch particle expanded and burst the surrounding shell after leaving the flame. It is these burning volatile gases which are identified as "matchsticks." The carbon shell quickly cools on leaving the combustion zone and drops out.

Observations of the flame at the burner tip clearly indicated that many pitch particles became plastic before reaching the tip and, on reaching the burner tip, would unite with others to form irregular plastic sheets. These remained suspended at the nozzle until knocked off by the operator or were swept away by the flame. Other plastic-pitch particles dropped onto the burner throat or the floor. Continual vigilance and considerable poking by the operator were necessary to keep the pulverized-pitch flame uniform and regular.

The worst trouble encountered was with flashbacks in the burner pipe. While operating at a constant rating and without warning, the pulverized pitch would suddenly ignite some 12 in. or so back in the burner pipe itself. If noticed immediately, the operator could rectify this by vigorously poking the burning plastic pitch forward into the furnace. But more often than not the plastic pitch built up so quickly that the burner was completely blocked. This was serious and necessitated a forced emergency shutdown.

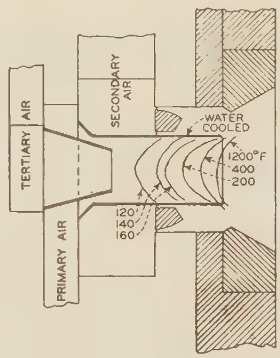

Fig. 13 Pitch Temperatures in Burner Pipe

These trial runs most forcibly pointed out the important fact that the temperature of the pulverized pitch must be kept below 190 F, the temperature at which pitch starts to become tacky, while it is still in the burner pipe. A series of temperature readings within the burner pipe were taken with a pyrometer while operating under the conditions described and with varying primary-air-fuel mixtures. They are plotted in Fig. 13. These tests served as the basis for a redesign of the burner and an altered mode of operation.

It was observed that the higher temperatures are in the center and that the temperatures varied with the primary-air-fuel ratio. The richer the fuel, the lower the temperature and, hence, decreased danger of flashbacks. This led to the conclusion that the incoming pulverized fuel must be shielded from the radiant furnace heat while still in the burner pipe. This could be partially effected by increasing the fuel density. The ignition zone would be advanced slightly away from the burner nozzle, and all other temperature zones would similarly be moved forward. The limiting factor, however, was the shape of this hot front zone or lines of equal fuel temperatures. To move the center forward sufficiently, so that its ignition took place at the burner tip and not within the burner pipe, meant that the ignition of the

outer ring of this paraboloidal-shaped fuel mixture took place too far away from the burner. Under these conditions, the ignition was unstable and the flame puffed.

These observations suggested the elimination of the center zone of the primary-air-fuel supply by extending the nozzle of the tertiary air to the burner tip, thereby confining the flow of the pulverized fuel to the annular space between the two water-cooled cylindrical nozzles. Temporary field changes were made on one

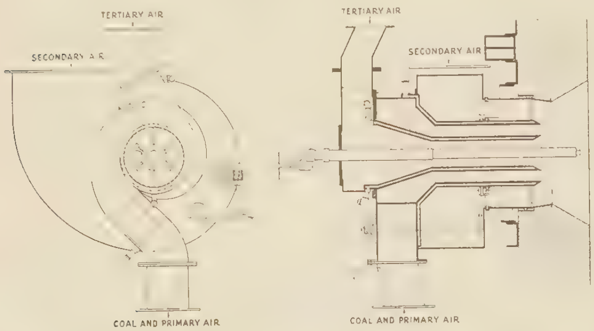

Fig. 14 Final Development of Combination Four-Fuel Burner

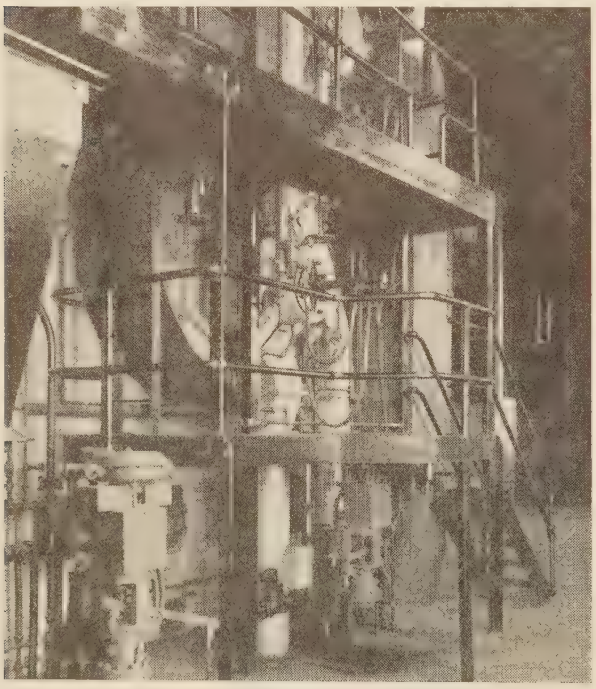

Fig. 15 Combination Four-Fuel Burner

burner. The improvement was marked. Dripping decreased, flashbacks were eliminated, but there still remained poor fuel distribution. Pitot-tube tests in the primary-air casing disclosed the presence of eddy currents at the junction of the inlet-supply pipe and casing. A good portion of the fuel would flow directly into the burner pipe without first passing around the volute casing. This by-passing was eliminated by the installation of a baffle at this point. Subsequent tests with pulverized pitch proved satisfactory.

To test these burner changes thoroughly, the unit was operated on pitch for a period of 40 days. During this period, temperature readings within the pulverizer were taken with and without water cooling. The difference was negligible and water cooling was discontinued even on the hottest days when the pulverizer air inlet was 100 F and outlet 105 F. Incidentally, it is important that there be no leakage of hot air into the pulverizer. The usual operating dampers are not tight and it was found necessary to blank off the hot air when operating on pitch.

At the end of this trial run, the burner, pipes, and pulverizer were thoroughly examined. The pulverizer was clean and showed no measurable wear in the race or balls. Pulverized fuel-pitch did coat the burner lead pipes, especially at the long sweep bends and the burner casing. It was deemed expedient to install clean-out doors at these points.

To note the effect of these burner changes on pulverized coal, the boiler was refired with this fuel. An improvement in burning this fuel was also noted, and it was therefore decided to rebuild both burners. In addition to the changes mentioned, the furnace ends of both the primary and tertiary nozzle were brought to a sharp edge in order to reduce the surface to which the plastic pitch might adhere. In the redesigned burner, more internal baffles were installed in the cooling jackets to insure the flow of cold water to the tip. All welds were ground down to obtain a uniform and smooth surface. Fig. 14 clearly shows these changed features. Fig. 15 illustrates the final combination four-fuel burner as it is today.

Automatic Combustion Control

During the development of this burner, the usual kinks encountered in adjusting a multifuel-firing boiler for 100 per cent automatic control were ironed out. A Smoot combustion-control system regulates the air-and-fuel input and automatically maintains their proper relation throughout the range, thereby resulting in a constant CO_2. A maximum-and-minimum-rating control is incorporated in the master controller to confine the rating of this unit between these two designated limits, regardless of the plant demand.

The Smoot control system, as applied to this unit, consists of an air-operated master controller and oil-operated regulators which measure and control the primary-air-fuel input when firing pulverized coal or pitch, the liquid-fuel input when firing oil or tar, air flow, and draft.

The master controller directly translates changes in header steam pressure into changes in air pressure (master loading) which pressure changes are pneumatically dispatched to the fuel-flow and air-flow regulators. Since the changes in steam-header pressure, the index of steam flow, vary as the square of the flow, it follows that changes in the master loading also vary as the square of the steam flow. This master-loading force, the impulse for air and fuel changes, is transmitted to the individual regulators. It is balanced against some measure or index of fuel-and-air flow which also varies as the square of the fuel flow or air flow. Thus, to control and measure liquid-fuel flow, the master loading is balanced against the pressure drop across an orifice in the fuel line. Since this pressure drop varies as the square of the fuel flow and the master loading varies as the square of the steam flow, the indexes of these flows can be directly balanced against each other. The regulator can be adjusted so that for a definite steam load there is a definite fuel input.

Air flow to this boiler is controlled indirectly by controlling the output of the combustion gases through the speed of the induced-draft fan. A change in the speed of this fan changes the furnace draft. A forced-draft fan, controlled by a weight-loaded regulator, automatically changes speed to maintain a predetermined furnace draft of 0.1 in. of water. In this manner the control of the output gases automatically controls the air input. As in the fuel regulator, the master loading is balanced against some measure of the gas flow which varies as the square

of the flow. Since gas flow is directly proportional to fan speed, and the pull of a speed governor, driven by the fan, varies as the square of the speed, the master loading can be balanced directly against the governor pull. This balance can be adjusted so that for a definite steam load there is a definite gas flow and, hence, air input. This relationship necessarily varies with different fuels but the regulator can easily and quickly be adjusted to follow the predetermined master-loading-speed curves for pulverized fuels and liquid fuels.

Since the master loading is an index of the quantity of fuel input and air input, it is only necessary to adjust the air master loading relative to the fuel master loading directly at the master

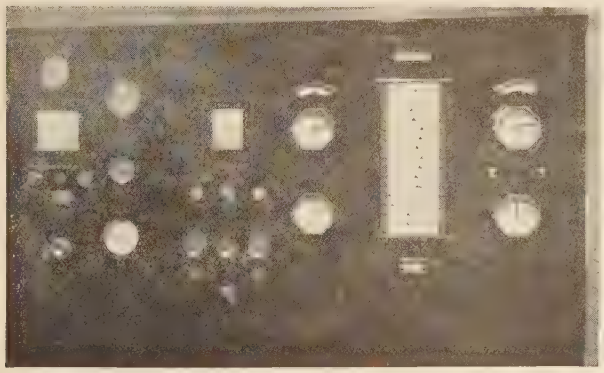

Fig. 16 Control and Gage Board

controller to alter the air-fuel ratio and, hence, CO_2. This the operator does from time to time as governed by the CO_2 reading, furnace observations, etc.

Numerous indicating pressure gages and thermometers of the multipointer type, as well as flowmeters, CO_2 recorders, haze combustion meter and smoke indicator, water-level recorder, and temperature recorders assist the operator in maintaining optimum conditions. A view of the control panel of this multi-fuel unit is shown in Fig. 16.

Among the interesting safety features installed on this boiler are the safety regulators which operate automatically to reduce the fuel input in case of partial failure of the air supply or induced-draft-fan failure. In case of complete failure, the electric interlocking of all auxiliaries automatically shuts down those ahead of the unit which failed. This electric interlocking of the auxiliaries also prevents their starting up in an improper and dangerous sequence. Each burner is equipped with an electric-eye flame detector which can be seen in Fig. 15. These and such important functions as feedwater pressure, primary-air pressure, oil pressure, furnace draft, and boiler differential are all equipped with electric alarm devices which operate to sound a signal gong and to light up their respective light signals on an annunciator board in case of partial failure. This trouble-analyzer-and-alarm signal system has proved its value on numerous occasions and is particularly helpful to the operator whose duties include the control of four stoker-fired boilers in an adjacent wing.

Flexibility of Four-Fuel Boiler

With the completion of the basic development of this four-fuel boiler, there remained yet to demonstrate its flexibility in changing from one fuel to another and to evaluate these fuels under normal plant-operating conditions. The switch from liquid-fuel firing, such as oil or tar, to pulverized coal or fuel-pitch is made without any change in rating and is fully controlled from the master controller. If desired, both liquid fuel and pulverized fuel can be fired at the same time in the same burner. To change from oil to tar or back to oil is a simple operation which entails no difficulties if the valve changes are made quickly and if both liquids have been conditioned to the proper viscosity. Tar is partially soluble in fuel oil and, in a mixture of about 50-50, there will be precipitated insoluble resins which form a liverlike substance which will be caught in the strainers. It is, therefore, good practice to minimize the time and area contact of tar and oil in this fuel change. Needless to say, oil should never be stored in a tar tank or vice versa, without first emptying the tank completely. A most troublesome sludge, impossible to handle with ordinary reciprocating pumps, will be the penalty.

The change from one pulverized fuel to another cannot be done directly, for different-sized balls are required as has been pointed out previously. The general practice has been to fire oil during the time required to change balls in the pulverizer, a period of about 4 hr, if continuity of service is desired.

Operating Results

During the last 2 years, the unit has been fired with oil, tar, and pulverized fuel-pitch. Changes in the prices of these fuels during this period warranted these switches. Compared to the prevailing prices of these fuels, pulverized-coal firing was uneconomical. Enough coal, though, was fired to obtain complete operating data and results under normal automatic operation to serve as the basis of comparison with these other fuels. Complete operating data and typical average daily results obtained with each fuel are listed in Tables 1 and 2.

The results given in the tables are those obtained under everyday operating conditions with a variable load and are, therefore, the results of interest to the management. Under test conditions with a constant load, the efficiency was found to be about 2 per cent higher. The blowdown and jacket-cooling-water losses, amounting to about 0.75 per cent and chargeable to the unit, are actually 90 per cent recovered in heat exchangers.

To determine the limits of minimum excess air, when firing liquid fuels, a series of tests was conducted with varying amounts of combustion air. Careful fuel-gas analyses of CO_2, O_2, CO, and unburned hydrocarbons were made with an Elliott gas analyzer. The tedious and lengthy task of analyzing for unburned hydrocarbons led to the suggestion of utilizing a standard commercial combustible-gas indicator, an instrument in common use with all gas and oil companies for routine check-up on gas- and vapor-explosion hazards. Parallel tests were conducted and in all cases the answer obtained with a combustible-gas indicator in less than 1 min agreed with that obtained on an Elliott apparatus. Thereafter, for a quick determination to detect the presence of any unburned combustible gases, carbon monoxide, hydrogen, or hydrocarbons in the boiler passes and exit the combustible-gas indicator was used. These tests indicated that with a fixed rating the minimum excess air can be reduced to 10 per cent without the occurrence of incombustible-gas losses when firing oil or tar. However, when operating with a variable load this must be increased to 15 per cent excess air.

It is noted that the efficiency when firing tar is about 1 per cent higher than with oil. The lower hydrogen content should actually result in a 2 per cent increase in efficiency. The carbon loss in the breeze, however, offsets this so the net gain is only about 1 per cent. The efficiency of pitch firing was expected to be somewhat lower, due to the use of cold primary air, but not to the extent experienced. This lower efficiency can be traced to the unburned carbon losses and, to date, this appears to be about the best that can be expected with this equipment and fuel. Whether it is the inherent characteristic of pitch remains only a speculation. Pitch is easily pulverized to a high state of fineness. In powdered form even at room temperature, it has a tendency

to cake more easily than powdered coal. This characteristic is no doubt more pronounced at higher temperatures. In its flow through the burner at velocities of 4000 fpm, collisions between particles occur which tend to raise the temperature of the particles. Furthermore, as the particles approach the burner nozzle they are subjected to the radiant furnace heat. Both factors work toward the formation of larger particles. All pitch particles, large or small, pass through the plastic stage before ignition occurs. This is the critical stage in pitch firing for, while in this form, all particles will stick together on contact. Small particles will chemically unite with the air and are consumed while yet in the combustion zone. The larger plastic particles burn, but the plastic condition of the surface does not allow the air to come in contact with the inner material before they are out of the combustion zone. It is a question of which takes place first, the union of the plastic pitch particle with air, or its union with an adjacent plastic particle. To minimize carbon losses immediate contact with the combustion air must take place.

Fuel Economics

Based on these day-in-and-day-out results, the economic value of each fuel which will produce the lowest over-all steam cost can be ascertained. Since supervision, labor, water, water treatment, and miscellaneous costs are common to all types of firing, with this unit the controlling factor remains fuel cost per 1000 lb of steam. Differential repair and power costs for the auxiliaries are contributing factors and must necessarily vary with different installations and methods of driving the auxiliaries. The curves in Fig. 17 are useful in determining the fuel cost in units of 1000 lb of steam for each type of firing and with varying fuel prices, or they can be used to arrive at the economic value of the other three fuels, compared to the price of one.

Thus, if fuel oil in the boilerhouse costs $1.15 per bbl the fuel cost per 1000 lb of steam is 23 cents. In similar manner, the fuel costs per 1000 lb of steam for the other three fuels, based on their respective delivered costs in the boilerhouse, can be read off this curve. Repairs and difference in boiler-auxiliary-power requirements modify these figures and, in the case at the Harrison Gas Works, these cost items are graphically presented in Fig. 18. If the average load were 75,000 lb per hr, these must be added to the fuel cost per 1000 lb of steam, as obtained in Fig. 17: 0.1 cent per M to the tar-firing cost, 0.5 cent per M to the pulverized coal-firing cost, and 0.7 cent per M to the pulverized fuel-pitch firing cost to obtain the true relative cost.

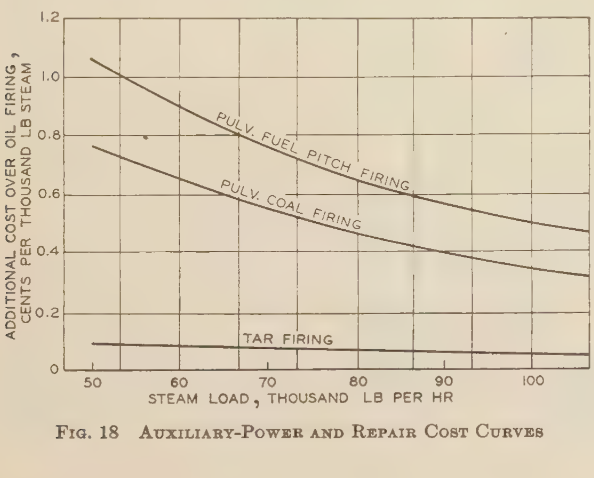

Fig. 18 Auxiliary-Power and Repair Cost Curves

Similarly, the "break-even" price in the boilerhouse of the other fuels compared to fuel oil can be ascertained from these two curves. Thus, if fuel oil costs $1.15 per bbl in the boilerhouse, tar is worth 3 cents per gal, also in the boilerhouse; bituminous coal $4.95 per net ton, delivered in the boilerhouse, and fuel-pitch $5.25 per net ton, also delivered in the boilerhouse. To arrive at the contract price, all handling and conveying costs from the receiving point to the boilerhouse must, of course, be deducted from these figures.

Actually, due to local circumstances, the evaluation of fuels in the Harrison Gas Works is somewhat more complicated by the fact that the operating costs of the chain-grate barley-firing boilers must be considered. At least three are always under fire and there arises the problem of economic load division between these and the new four-fuel boiler.

Conclusion

It is felt that this unit has met the general requirements of a multifuel boiler in its flexibility to change from one fuel to another even without shutting down, and its ability to handle all fuels equally well. It is a forward step toward the goal of a universal boiler and burner, a need of those who have a choice of fuels and demand continuity of service.

Discussion

G. W. Concklin.[2] The writer would like to convey some of the facts which he has encountered in the burning of by-product fuels. No doubt the burning of fuel-pitch and water-gas tar holds the most interest. Up to date we have used as boiler fuel 5,000,000 gal of tar and 7000 tons of fuel-pitch.

The burning of fuel-pitch presented quite a burner problem at first. With a standard coal burner, it was impossible to fire more than 3 hr without removing the burner for cleaning. To overcome these frequent shutdowns, we used water-cooled burners with copper tips and impeller vanes. This change enabled us to run continuously for 5½ days. Although quite encouraging, it did not prevent the dripping and part-clogging of the burners. The melting of the pitch and the clogging at the tip resulted in frequent blowbacks lasting from 15 min to 8 hr. We achieved the best results by keeping the primary air at 25 per cent and the temperature at 120 F. The velocities at the burner giving the best results were 3500 to 5000 fpm. We found it impossible to operate at velocities below 2800 fpm.

The pulverizing was done with a tube mill. In addition to a ball charge, it was necessary to add scrap gears as grinding media to prevent the fuel from packing the liners. A fineness of 75 to 90 per cent through 200 mesh did not have a marked effect on the burning.

At no time were we able to get over 80.5 per cent efficiency with an air heater in use. The high carbon and unaccounted-for losses were so high that we had to discontinue the fuel-pitch for economic reasons. The availability of the steaming output when burning pitch was about 85 per cent, the balance being produced with liquid fuels, Table 3 of this discussion.

TABLE 3 TYPICAL FUEL-PITCH FIRING BY MONTHS; GARNERVILLE BOILER NO. 1

	Jan., 1940	Feb., 1940	March, 1940
Total steam generated by boiler, lb	41,000,000	40,000,000	40,000,000
Steam generated from fuel-pitch, lb	37,500,000	34,000,000	31,500,000
Evaporation per pound of pitch	12.5	12.5	12.51
Availability, pitch firing, per cent	91.5	85	78.8
Balance of firing, per cent	8.5 (tar)	15 (tar)	21.2 (oil)
Efficiency, with pitch only, per cent	80.5	80.5	80.5

Notes: Boiler designed for firing four fuels.
Capacity, 70,000 lb per hr.
Boiler has complete waterwalls.
Furnace width, 12 ft 6 in.
Two burners (angular placement).
Firing depth, 19 ft.
Average heat release per cubic foot = 24,000 Btu.
Boiler run at base load.
Content of steam = 1015 Btu.
Content of fuel-pitch = 16,000 Btu.
Temperature leaving boiler, 585 F.
Temperature leaving air heater, 370 F.
Secondary-air temperature, 305 F.
Primary air (25 per cent) and fuel, 120 F (room + 40 F).
Continuous blowdown, 0.6 per cent.
Average CO_2 = 14.8 per cent.
Excess air = 25 per cent.
Firing this boiler with oil, an efficiency of 85.5 per cent was obtained.
Firing with water-gas tar, an efficiency of 87 per cent was obtained.

[a] Boiler designed for firing liquid fuels; capacity 55,000 lb per hr; two burners, placed parallel 5 ft 3 in. center to center; furnace width, 14 ft; firing depth, 18 ft; water-cooled front, bottom, and roof; no waterwalls at sides (walls 22 in.).
This boiler is giving 87.5 per cent efficiency for a 6-day continuous run; continuous blowdown, 0.5 per cent.

We have burned more than 4,000,000 gal of water-gas tar during the last year and find it to be an excellent boiler fuel. The availability of all three boilers was 100 per cent when firing this fuel. There are some minor precautions to be taken, such as correct heating, storing, and atomizing. In general, we consider it equal to oil. The additional 1 to $1^1/_2$ per cent efficiency gained compensates for the carbon loss. This carbon collects in the furnace and soot hoppers which are cleaned once or twice a week. We have found that this by-product fuel meets all theoretical expectations.

No. 3 boiler, which was designed especially for tar firing, has given a fine performance using this fuel. Performance data and the heat balance for this boiler, together with some observations therewith, are given in Table 4 and Fig. 19 of this discussion.

L. Coykendall.[3] This paper should prove to be of great service to the industry because it demonstrates the feasibility and economic advantage of burning various types and kinds of fuel in one unit. Particularly is this true at this time when warring nations are using great stores of oil, coal, and other fuels, with the resulting fluctuations in price. Many of the units sold for several years past, including large central-station boilers, have been designed for firing by several fuels.

A large percentage of the successful modifications and changes in the installation were suggested by the author, and to him should go a great deal of the credit for the present successful performance and operation of the equipment. However, he has not dwelt on the troubles experienced mainly because of the difficulty of burning fuel-pitch in a unit also adapted for three other fuels. If time permitted, he might have described the discouraging results of various changes before the final arrangement was obtained. These included the installation of various types of vanes and screw flights in the primary scroll to reduce pressure drop and correct poor distribution around the burner nozzle, and several changes to the secondary-air casing and burner throat.

The greatest difficulty was encountered with combustion of fuel-pitch, and the efficiency obtained will permit of considerable room for improvement. While the analysis of this fuel indicates that it is an ideal fuel from an efficiency standpoint, its potential value depends upon ability to overcome its peculiar properties. Among these are (1) the low softening temperature, and (2) the fact that, although the volatile content is high, the volatile constituents are all in the brackets which distill off at the higher temperatures. It will be noted that the efficiency of this fuel on this unit in everyday operations is around 80 per cent, whereas 85 to 86 per cent might be expected. This difference of about 5 per cent is attributed to unburned-carbon losses, as a result of the foregoing properties. An explanation covering the mechanics of this carbon loss is given in the paper in the first part of the section on "Fuel-Pitch." It is suggested for the benefit of those who may decide to use this fuel that probably a refractory furnace instead of one completely water-cooled would be beneficial in reducing this carbon loss. With the other fuels involved, however, this would be out of the question.

It should be pointed out that firing of gas could be adapted to this burner without effect on combustion of the other fuels and without any changes other than the installation of a standard gas ring at the burner throat.

Mention is made in the paper that breeze particles in gashouse tar are beneficial in cleaning soot or ash deposits from the air heater and other surfaces. In the last few years, slag and ash deposits on generating surfaces, resulting from bunker C oil firing, have become more troublesome as a result of new processes in the oil refineries. We know of several plants equipped for combination coal-and-oil firing where the operators fire coal periodically (say once a week for several hours) for the express purpose of cleaning the air heater and other surfaces. On this unit, it was found necessary to increase the steam pressure to the soot blowers to about 150 psi in order to clean the boiler surfaces effectively when firing bunker C oil. Provision was made to supply 90-lb-pressure steam when firing the other fuels.

The author is to be commended for his description of the instruments, automatic control, electric-eye flame detectors, electric interlocks, and other safety features. These are particularly necessary and useful in the efficient and safe operation of a multifuel unit.

D. S. Frank.[4] The paper is interesting from the standpoint of showing what can be done with equipment when time and effort is spent in making adjustments necessary for individual application.

Since the greatest difficulty was encountered with the fuel-pitch, the writer would question the necessity of burning this material in semisolid form. If the distillation had been carried out to a hard-coke residue, the handling characteristics would have been quite similar to coal. This should have eliminated the necessity for changing the ball race.

The writer is not familiar with the formation of fuel-pitch but, if the material is in a liquid form, as residue in the still, it should be possible to burn the pitch as a liquid. This would require suitable equipment for handling and atomizing. If this material could be removed from the still and burned as a liquid at such temperature as is required to obtain the desired viscosity of 18 sec Furol, no difficulty should be experienced.

Referring to Fig. 18 of the paper, it will be noted that the cost of burning fuel-pitch is 0.7 cent per 1000 lb of steam, higher than fuel oil. Based on a steam production of 75,000 pounds per hr, the daily cost of pulverized-fuel-pitch firing is $12.60. It is entirely possible that handling the material as a liquid might show a lower daily cost than $12.60.

The author states that a combination steam-mechanical burner is recommended over a straight mechanical burner in a "cold" furnace for oil firing. Does this hold true for both the 50,000- and 100,000-lb per hr production rate, or at what furnace-release rate in Btu per cubic foot are the burners equal? No mention is made of the cost of steam required for atomization, which may also have a bearing upon the choice of burners.

Author's Closure

When coal-gas or water-gas tar is distilled, there may be left, as a solid residue at atmospheric temperatures, a number of kinds of pitches depending upon the temperature of distillation and quantity of oils distilled. The higher the temperature and the more oils recovered, the higher will be the melting point of the pitch. Thus if about 14 per cent of the original charge is recovered as oils, there will remain a roofing pitch which has a melting point of 140 to 150 F. If this is increased to a point where about 22 per cent of the tar is recovered as oils, there will be left a briquette-pitch which has a melting point of 180 to 190 F. To continue to a point where tar is distilled at about 800 F, when about 49 per cent of the tar is recovered as oils, there will be left fuel pitch which has a melting point of 300 to 330 F. Therefore, it is understandable that the term pitch cannot be loosely used. It is important to describe the form specifically as roofing-pitch, briquette-pitch, or fuel-pitch.

Liquid roofing pitch has been successfully burned in boilers,

[3] Service Department, The Babcock & Wilcox Company, New York, N. Y.

[4] Pure Oil Company, Chicago, Ill.

for it need only be heated to about 350 F to obtain the desired viscosity of 18 sec Furol. However, to burn liquid fuel-pitch requires that it be heated to at least 700 F to obtain the proper viscosity for atomization. This, of course, requires special heating equipment, such as an externally fired boilerf or heating the fuel-pitch and special heated storage tanks. The pumping equipment, piping, and valves should all be steam-jacketed and designed for this temperature. The cost of this equipment, coupled with unduly high maintenance, is prohibitive compared to the advantages, if any, of liquid-fuel-pitch firing over pulverized-fuel-pitch firing.

The distillation of tars is often done to recover oils, in which case fuel-pitch is a by-product and not the end in itself. It must be handled as is, and up to now fuel-pitch is best handled and burned in boilers as a pulverized fuel. The author knows of no plant in this country where fuel-pitch is burned in liquid form. There are several installations where pitches of lower melting point, such as roofing pitch, are burned in liquid form.

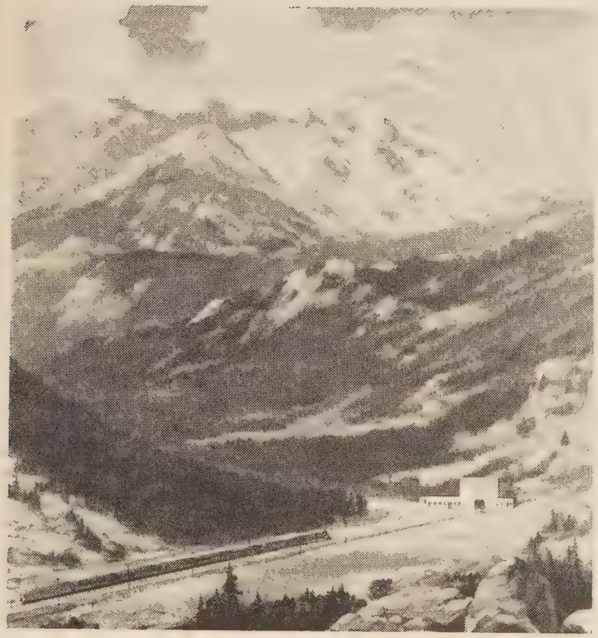

Fig. 1 East Portal of Moffat Tunnel

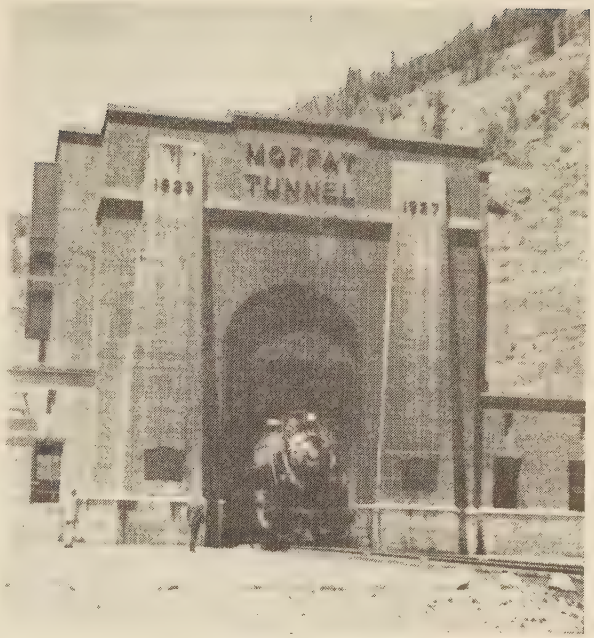

Fig. 2 East Portal of Moffat Tunnel With Curtain Raised

Piston Effect of Trains in Tunnels

By R. L. DAUGHERTY,[1] PASADENA, CALIF.

The author was recently engaged by the Denver and Rio Grande Western Railroad to make a study of the ventilation of the Moffat Tunnel, which is 6.21 miles in length. In the course of this work measurements were made of the friction of air through the empty tunnel and also of the air pressures developed by different trains of various lengths passing through the tunnel at speeds ranging from 15 to 38 mph. The results of this investigation are presented in the form of curves for a wide variety of conditions. The mathematical analyses are given, which may be applied to the problem of tunnel ventilation in general. For the reason that but little information concerning the subject of "piston action" of trains in tunnels is available in the engineering literature, the author deems it desirable to make the present data a matter of record.

The Moffat Tunnel, completed in 1928 at a cost of \$18,000,000, pierces the Rocky Mountains some 50 miles northwest of Denver, Colorado, and is used jointly by the Denver and Rio Grande Western Railroad and the Denver and Salt Lake Railroad. Originally 16,593 ft of its length were timber-lined, but the timbering has been completely replaced with concrete by now. The remainder of the length is through granite rock which has been covered with gunite. This portion is naturally rough and irregular and varies in cross-sectional area. The standard concrete section is shown in Fig. 3. The essential dimensions of the tunnel sections are shown in Table 1.

TABLE 1 MOFFAT TUNNEL DIMENSIONS

Type	Length, ft	Area, sq ft	Perimeter, ft	Hydraulic mean radius, ft
Concrete-lined	17446	340	71	4.8
Concrete-lined	985	310	68	4.6
Rock, gunited	14374	340 to 450	77 Avg	5.2Avg

The east portal of the Moffat Tunnel is at an elevation of 9195 ft above sea level and the west portal is 112 ft lower. In order to secure drainage, the tunnel slopes both ways from a high point in its central portion, which is 42 ft higher than the east portal and 154 ft higher than the west portal. For equilibrium, the barometer at the west portal should be 0.087 in. of mercury higher than at the east portal. However, because of the high mountain range separating the two ends of the tunnel, the barometer differences are often much greater than this value. Occasionally the pressure at the west portal is as much as 2 in. of water more than at the east end, and at times it has been found to be 1.6 in. of water less. Any measurements of tunnel friction must be corrected for the barometric pressure differences, due allowance being made for the static difference because of the 112-ft difference in elevation. That is, for an air flow from east to west the tunnel pressure at the east portal will be increased not only by the tunnel friction but also by an amount

$$\Delta B = 13.6\ (B_w - B_e - 0.087) \qquad [1]$$

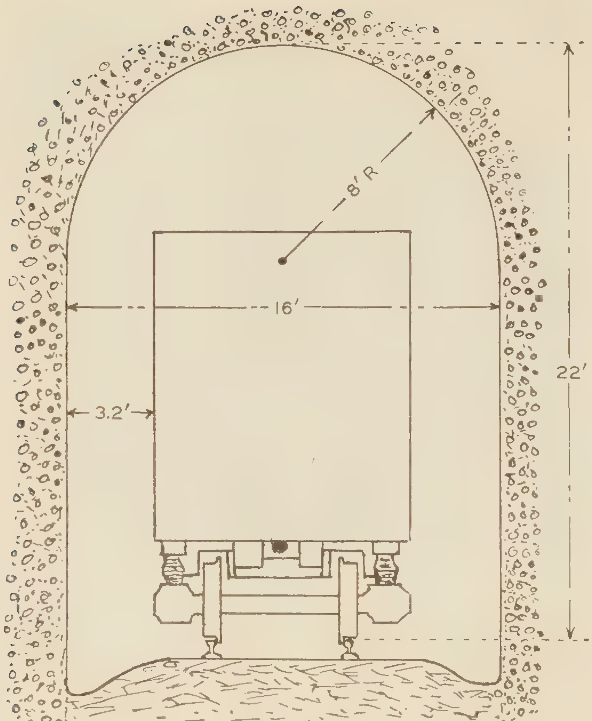

Fig. 3 Standard Concrete-Lined Section; Moffat Tunnel

where ΔB = adverse barometer in inches of water
B_w = barometer at west portal in inches of mercury
B_e = barometer at east portal in inches of mercury

When the air is exhausted from the east portal so that the flow is from west to east, the vacuum at the east portal will be decreased by the same quantity.

At the elevation of the Moffat Tunnel, the barometer is normally about 21.2 in. of mercury or 10.4 psi. The outside-air temperature ranges from 80 F to —40 F, but the temperature in the tunnel is constant at 58 F. The specific weight of air at the time of the tests was 0.055 lb per cu ft.

System of Ventilation

The tunnel is ventilated by fans which are housed at the east portal. By means of dampers, the fans may be so operated as to blow air into the tunnel and cause it to discharge at the west portal; or they may exhaust from the tunnel, thus producing a flow from west to east. Such operation is made possible by closing the east portal by means of a tightly fitting door or curtain made of numerous plys of heavy canvas. This curtain is raised only long enough for a train to pass the portal. It is made of canvas in case it should fail to open at the right time and the locomotive should then plow through it.

Tunnel Friction

The friction of air in the tunnel, when no trains are passing through, can be determined by measuring the tunnel pressure just inside the closed door at the east portal by means of a water manometer, one leg of which is open to the outdoor air. The reading will be positive, if air is being blown into the tunnel and negative, if it is being exhausted. The true tunnel friction will be this reading corrected for the adverse barometer, if any, as defined by ΔB.

The quantity of air flowing through the tunnel was determined in these tests by the use of an anemometer at a section near the west portal. Air velocities were measured at 21 different points over the cross section. From determinations made at several different rates of flow, the equation for friction in the Moffat tunnel was found to be

$$F = 1.08 \times 10^{-11} Q^2 \qquad [2]$$

where F = inches of water
Q = flow of air, cfm

In order to make this result useful in other cases, it is necessary to evaluate the friction coefficients involved. If the tunnel were uniform throughout its length, that would be a very simple matter. But the variation in the cross-section areas and in the character of the tunnel lining renders a direct procedure impossible. Consequently, the friction was computed on a purely theoretical basis to see if the total result would check. If it did, it would either prove that the individual assumptions were correct, or else that their errors were such as to compensate.

For air at 60 F, the absolute viscosity is 0.018 centipoises or 0.00000038 lb sec per sq ft, and this multiplied by g is 0.0000122 lb per ft sec. Dividing this latter by 0.055 lb per cu ft gives the kinematic viscosity of the air in question as 0.000222 sq ft per sec.

In the standard concrete-lined section, an air flow of 300,000 cfm would give a velocity of 14.7 fps. A section with a hydraulic-mean radius of 4.8 ft would correspond to a circular conduit with a diameter of 4 ft × 4.8 ft. Therefore, the Reynolds number would be

$$R = \frac{4 \times 4.8 \times 14.7}{0.000222} = 1{,}270{,}000$$

Using Pigott's diagram[2] for friction factor, rough-formed concrete would be in class E of his table.[3] For an equivalent diameter of 4 × 4.8 = 19.2 ft, the table would specify curve 2 of the diagram. For this curve and a Reynolds number of 1,270,000 the diagram would give f = 0.013.

For the standard concrete-lined section, the friction would then be

$$f \times \frac{L}{4m} \times \frac{V^2}{2g} = 0.013 \times \frac{17{,}446}{19.2} \times \frac{14.7^2}{64.4} = 39.7 \text{ ft of air}$$

which equals 0.418 in. of water in this case.

There can be little question as to the accuracy of the value of f for the concrete lining; and a similar computation for the 985-ft length gives a friction head of 2.8 ft of air.

The difficulty lies in the proper estimate of the value of f for the rough and irregular rock-wall sections. The Pigott diagram is hardly applicable to surfaces as irregular as this, and hence it seems desirable to turn to data on large open channels, many of which are equally rough and irregular. Because the gunite smooths up the minor roughnesses, a value of Kutter's n of 0.021 was finally decided upon. Using Manning's formula this gave a value of C of 92.5 in the well-known formula $V = C\sqrt{ms}$ and, since $f = 8g/C^2$, the value of f is 0.03. Therefore, for the gunited-rock portion, the friction would be

$$f \times \frac{L}{4m} \times \frac{V^2}{2g} = 0.03 \times \frac{14{,}374}{20.8} \times \frac{12.5^2}{64.4} = 50.5 \text{ ft of air}$$

Adding the friction losses in the three sections shown in Table 1, the result is 93 ft of air or 0.98 in. of water.

[2] "Hydraulics," by R. L. Daugherty, Fourth edition, McGraw-Hill Book Company, Inc., New York, N. Y., 1937, p. 211.

[3] "The Flow of Fluids in Closed Conduits," by R. J. S. Pigott, *Mechanical Engineering*, vol. 55, 1933, p. 497.

For a flow of air of 300,000 cfm, the experimental result, as given by Equation [2], is 0.972 in. of water. The close agreement obtained would indicate that the values of f employed are very nearly correct.

Time and Power Required to Clear Tunnel

Coal-burning steam locomotives are used through the Moffat Tunnel, and hence it is of great interest to know the time interval required to clear the tunnel of smoke after a train has passed through and the power required for the operation of the fans for different time intervals. In Fig. 4 is shown the relation between the volume of air supplied per minute and the time required for this air to traverse the tunnel. Because of mixing of the incoming air with the smoke, it is probable that the time required to clear the tunnel completely may be something like 50 per cent more than that shown in Fig. 4. The curve showing the relation between volume of air per minute and time required is a rectangular hyperbola and, as seen in Fig. 4, the quantity of air required increases rapidly as the time is decreased.

By the aid of Equation [2], which gives the friction head for the tunnel, it is now possible to compute the air horsepower required for any given rate of air flow, and hence for any given time of clearing. By assuming a constant fan efficiency, the actual horsepower required to operate the fan for these various rates of flow can be determined, as shown also in Fig. 4. Because the power required varies as the cube of the rate of air flow, it is seen that the power increases enormously as the time of clearing the tunnel is decreased. It is thus apparent that there is a minimum time for clearing the smoke from the tunnel below which it is not economical to go, because of the high power costs.

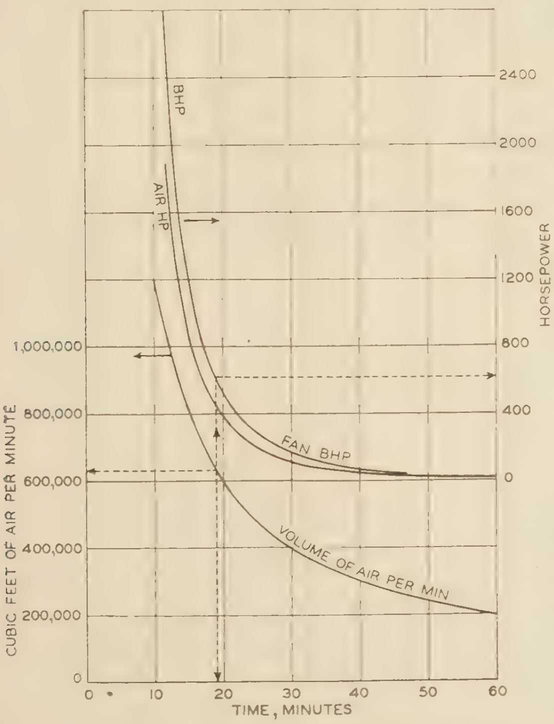

Fig. 4 Ventilation of Moffat Tunnel With No Train in Tunnel, Showing Time for Air to Traverse Tunnel; Time to Clear Tunnel Is Approximately 50 Per Cent More

Thus for fresh air to traverse the length of the tunnel in 20 min, and probably clear it completely in 30 min, an air flow of 600,000 cfm is required, and the necessary power input to the fan will be 530 hp. But to traverse the tunnel in 15 min will require 1200 hp.

Piston Effect of Trains in Tunnel With One End Closed

A formula will now be developed for the train resistance when it is proceeding toward the closed end of the tunnel and air is being blown into the same end so that the air flow is in the opposite direction to the motion of the train.

It will be assumed that the train resistance, which is the same quantity as "piston effect," is proportional to the square of the relative velocity of the air past it. Let

A = tunnel cross-section area, sq ft
a = train cross-section area, sq ft
Q = volume of air from fan per unit time = AV, cfm
V = velocity of air in unobstructed tunnel = Q/A, fpm
S = train speed, fpm

Assume first that the fan is not operating so that $Q = 0$, $V = 0$. The train will then displace air in front of it at the rate aS. This volume of air per unit time will have to flow back past the train through the area $(A - a)$. If the fan is also operating, the total flow past the train will be $aS + Q = aS + AV$. The absolute velocity (i.e., relative to the tunnel wall) of the air past the train will then be $(aS + AV)/(A - a)$. But the velocity of this air relative to the moving train is

$$\frac{aS + AV}{A - a} + S = \frac{AS + AV}{A - a} = \frac{AS + Q}{A - a} \quad \ldots\ldots [3]$$

In accordance with the assumption previously made, the train resistance or its piston action is then given by

$$P = K(AS + Q)^2 \quad \ldots\ldots\ldots\ldots\ldots\ldots [4]$$

where K is a constant for each train in a given tunnel.

For the Moffat Tunnel, A is known and K was determined for a series of trains by observing the tunnel pressure in each case as well as by determining the fan discharge, and observing the train speed. However the preceding can be generalized.

From Equation [3] it can be seen that K must involve $(A - a)^2$. Also it would seem reasonable that it would be proportional to the length of the train as well as including an "end effect," and that it would be proportional to the density of the air. Therefore

$$K = \frac{M + NL}{(A - a)^2} w \quad \ldots\ldots\ldots\ldots\ldots\ldots [5]$$

where M and N are constants and L is the length of the train. For a single locomotive without any cars, it is probable that the end effect, represented by M, might be apparent, but for the trains involved in these tests, which ranged from a locomotive and tender with two cars making a total train length of 277 ft up to a 50-car freight train with a total length of 2410 ft, the end effect seemed to be negligible. Assuming then that $M = 0$, for all practical purposes, the formula for train resistance of any train at any speed in any tunnel with one end closed would be

$$P = \frac{wNL}{(A - a)^2} (AS + Q)^2 \quad \ldots\ldots\ldots\ldots [6]$$

From the data obtained with the trains in the Moffat Tunnel the value of N would seem to be 328×10^{-11}. Therefore, for this type of tunnel, the formula may be tentatively given as

$$P = \frac{328 \times 10^{-11} wL}{(A - a)^2} (AS + Q)^2 \quad \ldots\ldots\ldots\ldots [7]$$

With this value of the constant, the units on the right-hand side of the equation are in feet, pounds, and minutes, while P is the pressure produced by the train in inches of water.

The general formula given by Equation [6] is offered with some confidence, but the exact value of the constant appearing in Equation [7] is not so certain. The tunnel pressure readings varied considerably while trains were passing through the tunnel. The reasons for this are that the train speed is not constant, being less than the average upgrade and more than the average on the downgrade after passing over the summit in the center of the tunnel; the tunnel cross-section area varies as shown in Table 1; the roughness of the tunnel wall varies from place to place; the fan speeds were not kept constant because of certain operating necessities in the fan room; and thus the air flow was not the same throughout the train trip. Hence, it is obvious that these data lack the precision of laboratory values. But, in spite of these difficulties, it is believed that the results obtained are close approximations to the truth and may be used with all due allowances for these various uncertainties.

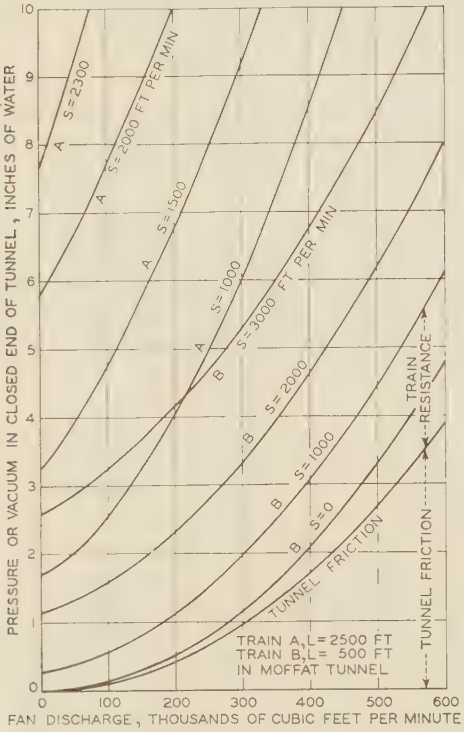

Fig. 5 Air Flow Opposite to Direction of Train

Total Tunnel Pressure at Closed End

The total pressure in the closed end of the tunnel when air is blown against an approaching train is the sum of the foregoing, that is

$$T = F + P + \Delta B \quad \text{[8]}$$

If the train were proceeding in the opposite direction and air were being exhausted from the closed end of the tunnel, then a vacuum would be obtained, which would be

$$\text{Vacuum} = F + P - \Delta B \quad \text{[9]}$$

If it were not for the barometer effect, the increase in tunnel pressure above the atmospheric pressure for the one case would be the same as the vacuum obtained when the direction of both the air flow and the train was reversed. In both cases, the flow of air would be against the motion of the train. Equation [8] or [9] gives the value of the "head" which must be developed by a fan in order to provide the specified air flow. The performance of trains in a tunnel with a closed end and the air flow against the motion of the train is shown in Fig. 5, assuming $\Delta B = 0$. The effect of a barometer difference is merely to shift all of the curves up or down by the amount ΔB.

In Fig. 5 may be seen the effect of changing the speed of the same train and also the difference between a short train and a long train, when both are operated at the same speed. Pressures as high as 8.7 in. of water and vacuums as high as 8.2 in. of water have been observed when the fan was in operation. With the fan shut down and all dampers closed, a vacuum of 7 in. of water has been noted. Thus the diagram in Fig. 5 does not extend much beyond some of the operating points.

Air Flow in Same Direction as Train Motion

In the two cases previously cited, the air flow was against the motion of the train. If the air flow from the fan were in the same direction as the train travel, Equation [4] would be changed to

$$P = K(AS - Q)^2 \quad \text{[10]}$$

and the same change of sign would apply to Equations [6] and [7]. The effect of this change of sign is to decrease very greatly the value of the train resistance.

If AS is greater than Q, the train speed will be greater than

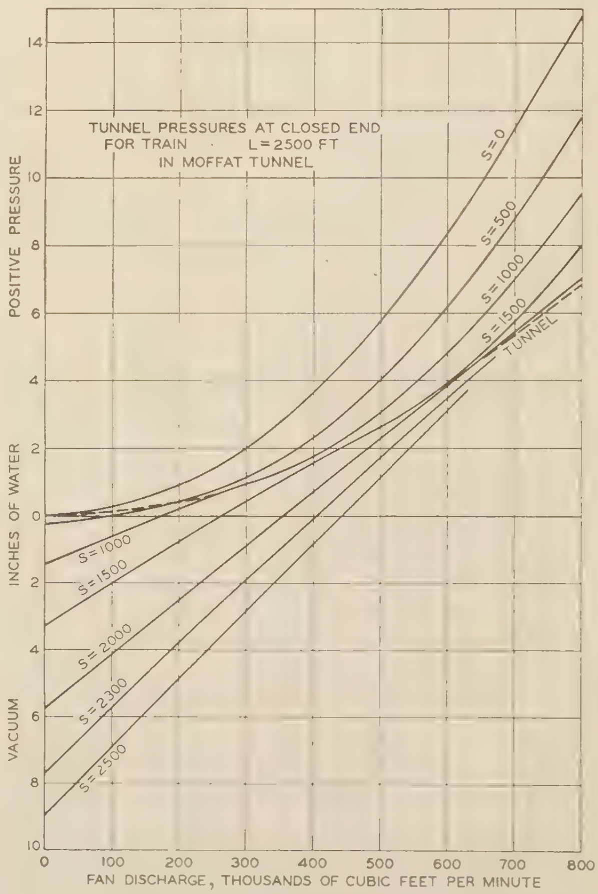

Fig. 6 Air Flow in Same Direction as Train Motion

the velocity of the air in the tunnel behind it, and some air will still flow past the train from the front to the rear. Equation [8] is then changed to

$$T = F - P + \Delta B \quad \ldots\ldots\ldots\ldots [11]$$

which shows the saving in power which may result from blowing air behind a train instead of against it. This is shown more clearly in Fig. 6.

When the train speed S is greater than the air velocity V the pressure in the tunnel at the closed end is less than that due to tunnel friction alone. If the piston action P is greater than the tunnel friction F, the tunnel pressure then becomes a vacuum. The maximum vacuum obtained is when the fan is not operated and all dampers are closed.

When the air velocity and the train speed are equal, the piston effect of the train becomes zero and the curves, shown in Fig. 6, then cross the tunnel-friction curve.

When the train speed is less than the air velocity, some air will flow past the train from the rear to the front. For this condition it is necessary to revert to Equation [8] which adds

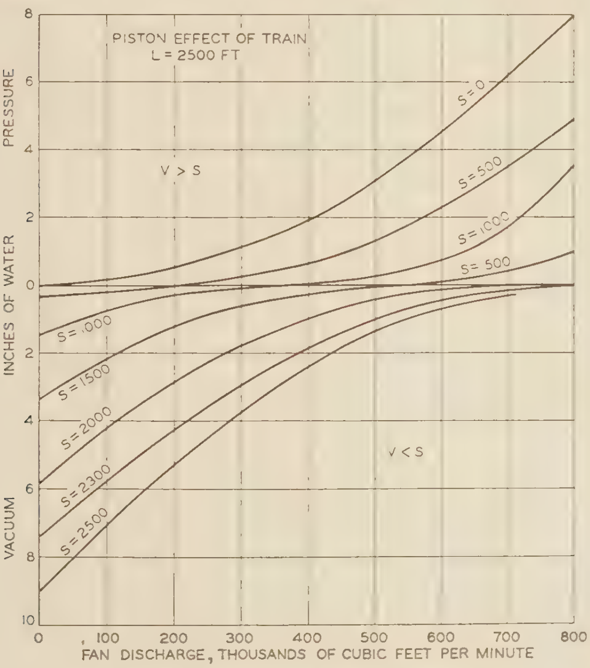

Fig. 7 Air Blown Behind Train

the train effect to the tunnel friction. However the tunnel pressure is still much less than with the same fan discharge blowing against the train, because P is still to be computed by Equation [10]. Comparing Figs. 5 and 6 for the large air flows, will show the great reduction in tunnel pressure and hence in fan power required.

The piston action of the train alone, for this condition of operation, separated from any effect of tunnel friction, is shown in Fig. 7. Each curve crosses the zero axis when the air velocity is equal to the train speed.

Train Tunnel With Both Ends Open

The use of a door or curtain to close one end of the Moffat Tunnel was necessary in order that the fan could force air to flow through the tunnel from one end to the other. The cost of a separate duct to deliver air at intermediate points along the length of the tunnel would have been prohibitive, since it would have been comparable in size with the tunnel itself, or else would have required very high velocities and a large expenditure of power, if it were smaller. However tunnels with both ends open are much more common, the ventilation in such cases being provided in other ways.

The analysis made for the Moffat Tunnel can be modified so as to apply to a tunnel with both ends open. Since a fan can no longer be employed to produce a flow of air through the entire length of the tunnel, it will here be assumed that no fan is in service. Such a condition of operation might very reasonably be employed for the Moffat Tunnel, for example, if electric locomotives were used. In fact the ventilation obtained without the use of a fan might even be sufficient if Diesel locomotives were to replace the present coal-burning steam locomotives.

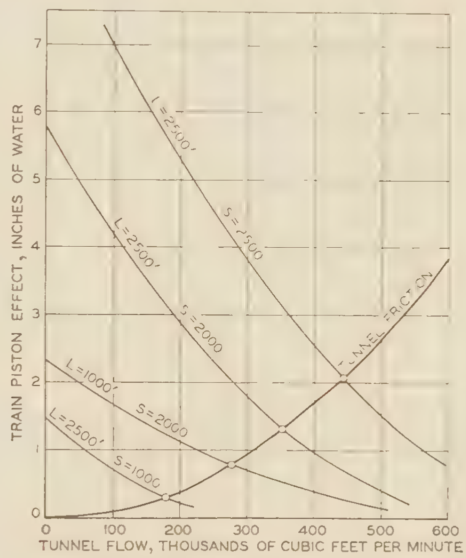

Fig. 8 Piston Effect With Both Ends of Tunnel Open

The physical facts in this case are then as follows: The train will displace air at the volume rate aS. Some of this air will be forced out of the open end of the tunnel ahead of the train and will be replaced by an equal volume of air drawn in at the rear portal of the tunnel. Also some of the air will flow back past the train from front to rear. If q is the volume of air which flows through the tunnel, as a result of the piston action of the train, and q' is the volume which flows back past the train, then

$$aS = q + q' \quad \ldots\ldots\ldots\ldots [12]$$

The quantity of air q is now the amount of the tunnel ventilation. The tunnel friction corresponding to it is then given by Equation [2], which may be written as

$$F = 1.08 \times 10^{-11} \times q^2 \quad \ldots\ldots\ldots\ldots [13]$$

This friction head, shown in Equation [13], can be supplied only by the action of the train. It is the same in value as the so-called "piston action," or is the same as the difference in pressures in front of and behind the train. This pressure difference is produced by the resistance to the flow of air past the train and relative to it. Therefore $F = P$.

The absolute velocity of the air past the train is $q'/(A - a) = (aS - q)/(A - a)$, while the relative velocity is

$$\frac{AS - q}{A - a} + S = \frac{AS - q}{A - a}$$

It will be assumed that the train resistance is proportional to the square of the relative velocity of flow past it, so that

$$P = K\,(AS - q)^2 \qquad [14]$$

where K has the same numerical value as in Equation [4] or [10]. Since $F = P$, the value of q can be determined by equating the tunnel friction to the train resistance. When q is known, the train resistance can be computed.

Thus for the Moffat Tunnel, as an illustration

$$1.08 \times 10^{-11} \times q^2 = K\,(AS - q)^2$$

Assuming a train 1000 ft in length running at 2000 fpm, this expression becomes

$$1.08 \times 10^{-11} \times q^2 = 0.5 \times 10^{-11}(680{,}000 - q)^2$$

The solution of this equation gives the tunnel ventilation as $q = 275{,}000$ cfm of air with a tunnel friction of 0.82 in. of water. With a train displacement of $aS = 190 \times 2000 = 380{,}000$ cfm, the flow of air past the train from front to rear is $380{,}000 - 275{,}000 = 105{,}000$ cfm. The piston action of the train is, of course, also 0.82 in. of water.

The simultaneous solution of Equations [13] and [14] is shown graphically in Fig. 8. The solution in each case is the point of intersection of a train curve with the tunnel-friction curve. The co-ordinates of this point of intersection give the values of the tunnel ventilation and the piston effect. This diagram shows the value of tunnel speed in securing tunnel ventilation, and it also shows the effect of train length for the same speed.

Determination of K

The analysis, which has been presented in this paper, of the performance of trains in the Moffat Tunnel under all possible conditions of operation, rests upon two assumptions: (1) That the piston effect is properly expressed by Equation [4] or a modification thereof, and (2) that the value of K is constant for a given train, depending only upon the length. However, the value of K is affected by the area of the tunnel, as shown by Equation [5], and it is also affected by the wall roughness. Since the tunnel is not uniform throughout, obviously the value of K for a given train must vary according to the position of the train in the tunnel. Hence, the value of K used for each train is in reality an average value.

However, observations have been made of tunnel pressures with the air flow opposed to the motion of the train, with the air flow in the same direction as the train, and with zero flow with the fan not operating. The values so obtained are all consistent with the curves shown in Figs. 5 and 6.

While it is desirable that values of K be obtained by direct measurement with trains in the tunnel in question, the practical necessities of railroad operation are such that it is not always possible to maintain uniform conditions during a given run so that reliable values may be obtained. Where it is not feasible to measure the piston effect of a train at all, an approximate value of K might be computed in the following manner:

Assume the train to be stationary in some interior portion of the tunnel, which is an operating condition not to be tolerated in reality. Then Equation [4] reduces to $P = KQ^2$. The friction of air through the annular-like space between the train and the tunnel walls is

$$P = \frac{w}{5.2} \times f \times \frac{L}{4m} \times \frac{v^2}{2g} \qquad [15]$$

where w is specific weight of air in lb per cu ft, 5.2 is a constant to give P in inches of water, L is the length of the train, m is the hydraulic radius for the space and equals $(A - a)$ divided by the entire perimeter, and $v = Q/60(A - a)$. If one can estimate the proper value of f for such a passage, then the value of K is established. Thus, for the value of K determined by experiment in the Moffat Tunnel, the corresponding value of f will be found to be 0.0301.

Results of Moffat-Tunnel Studies

In addition to providing information regarding the piston action of trains in tunnels in general, the tests made with trains in the Moffat Tunnel pointed the way to better operation with more rapid clearing of smoke from the tunnel and reduced cost of fan operation. The two fans originally installed were for too high a pressure and too low a capacity. By replacing one of these with a lower-pressure but higher-capacity fan, the smoke can be cleared from the empty tunnel more rapidly and with less expenditure of power. Also it was seen that much power could be saved by blowing air behind a train instead of against it. As long as the train speed is in excess of the air velocity in the tunnel, there will still be a flow of air from the front of the train to the rear. The train crews report more satisfactory conditions with this change of operation.

For the present, one of the old fans is still used to blow air against eastbound trains, because the latter climb more of a grade and hence move more slowly. Thus air is sent in only one direction through the tunnel at all times. Formerly when the air movement was against the train motion and when trains alternated in direction through the tunnel at frequent intervals, the smoke in the middle was shifted back and forth without having an opportunity to reach an exit.

Acknowledgments

The author wishes to express his appreciation to Mr. E. A. West, general manager of the Denver and Rio Grande Western Railroad, for permitting publication of the information obtained; to Mr. Durbin Van Law, Mem. A.S.M.E., for assistance in making the tests, as well as to the engineering staff of the D.andR. G.W. for their co-operation.

Discussion

J. C. Miles.[4] Has an investigation been made of the ventilating effect that could be obtained from a vertical "chimney" drilled from near the middle of the tunnel to the surface? This question is asked without knowledge of the prevailing temperatures, winds, and barometer, as well as depth of tunnel below the surface. Any of these factors, it is realized, may make the question pointless.

Durbin Van Law.[5] The investigation described in this paper was occasioned directly by unsatisfactory conditions prevailing in the ventilation of the Moffat Tunnel. Discomfort to passengers and to operating crews was not infrequent. That condition has been changed due to remedies which have been applied as the result of the author's studies. In the development of theory, it is interesting to find the conclusions sustained by facts in the nature of actual performance, and this discussion will be confined to a few statements of this specific character.

When the Moffat Tunnel was completed in 1928, it served one railroad, namely, The Denver & Salt Lake Railway, operating only approximately 200 miles of main-line track and having an expectancy of peak traffic amounting to not more than sixteen

[4] Instructor in Mechanical Engineering, University of Illinois, Urbana, Ill. Jun. A.S.M.E.

[5] Consulting Engineer for the Denver and Rio Grande Western Railroad, and the Denver & Salt Lake Railway, Denver, Colo. Mem. A.S.M.E.

train movements per day. Electrification of the tunnel was considered and discarded because of the expensive operation which would have been entailed for this very light degree of traffic. Careful searches had preceded tunnel construction to determine if possible the operating experiences of other comparable tunnels. Surprisingly meager data were available in general and nothing reliable was discovered which was applicable to the piston effect of trains. A ventilating plant was designed upon the basis of suppositions which did not materialize into fact, with the result that ventilating fans were installed to operate against a discharge pressure many times that actually developed after the tunnel was put into operation. To accentuate the difficulty, overloading-type fans were selected, with the result that the air quantity had to be throttled by artificial restrictions to hold the power within the limits of the motors used for fan drive. With tunnel friction so much less than was anticipated, operation of the fans with the tunnel empty became a most inefficient operation. When ventilating with a train actually in the tunnel, operating conditions were, from a mechanical standpoint, somewhat improved. This was, of course, due to the resistance or increased friction imparted by the train itself, which the author has classified as "piston effect" and which he has most capably reduced to specific formulas.

Now, since it appeared that the principal resistance in any blowing operation is imparted by the train rather than the tunnel walls, it became desirable to eliminate as much of this piston effect as was possible. The simplest way to accomplish this result was to blow behind trains instead of against them. It was not feasible to blow at such a rate that the products of combustion would be carried ahead of the engine. That would require too much power, in consideration of the fact that some of the passenger trains traverse the tunnel in as little as $8^1/_2$ min, and practically all the freight trains clear in 17 min or less. Therefore, it was decided that new fan equipment should be designed to blow behind westbound trains at a rate less than train speed. In reality, this procedure is based upon the theory that the ventilation provided by the train itself is sufficiently great so that it may actually be diminished to some slight degree by lessening the vacuum which would otherwise appear behind the train, and this through the medium of blowing at less than train speed. In this regard, it is startling, but nevertheless true, to state that were a train to enter the tunnel when it was filled with suffocating gases, no fan made within any reasonable limits of power input could possibly afford relief to the train crew until the train had actually traversed nearly two thirds of the tunnel length.

There is a definite reason why a following movement of air was not decreed in the case of eastbound trains—in fact, two reasons. The author states that the train movement eastbound is somewhat slower on account of the relatively steeper grade. In addition to this circumstance, it was desired that only clean air be taken through the fans on account of otherwise resulting corrosion to fan blades and dampers. The installation of new fan equipment has actually been used somewhat differently from that contemplated at the time of the author's studies. For eastbound train movements of passenger trains and certain freight trains, no fan whatever is used, and the train is allowed to proceed through the empty tunnel with the curtain or door on the east end closed during its passage, up to the point where it has to be opened to permit the train to emerge. This, again, is a manifestation of piston effect, this time in its simplest form and not complicated by air movement due to the effect of a fan.

The entire theory of tunnel operation in so far as ventilation is concerned is that trains are seldom bothered with the smoke from their own engines. If the tunnel is clear with the entrance of the train, ventilation is usually satisfactory. It was, therefore, the desire to create revised facilities which would clear the tunnel in the shortest space of time, thus permitting daily train movements of several times the number originally contemplated. Since the Denver & Rio Grande Western Railroad has established rail connection through the tunnel and on to its main line at Dotsero, the system has become one of the principal carriers to and from the Pacific Coast, and traffic intensity has grown by rapid bounds.

The Moffat Tunnel is the longest railroad tunnel in the world now utilizing steam power, and the only one of comparable length utilizing coal fuel. The ventilating plant has been revised through the installation of a new fan unit built to conform to pressure-volume characteristics as determined by the author's studies. Its performance almost exactly follows performance predictions for tunnel ventilation as laid down in his advance work. Cleaning time with the tunnel empty has been reduced by nearly 50 per cent, while power costs have been reduced by 35 per cent. Of primary importance is the fact that operation is now clean and, in consideration of the type of motive power, provides the very minimum of discomfort to train crews and none at all to passengers. In the latter respect it is very easy to forget that gases, like all fluids, tend to equalize as to pressure differences. Therefore, if a relatively high pressure exists within the tunnel and a normal pressure within the passenger coaches, there is certain to be an infiltration from the tunnel into the coaches. The lower this differential can be maintained, the less the infiltration effect. The present scheme of operation, with due cognizance of the pressure imparted by piston effect, holds down the tunnel pressure to the lowest point compatible with sufficient displacement to provide adequate ventilation.

Actual performance has attested the accuracy of the author's theoretical determination. The ventilating plant is operating according to schedule. To those who may be confronted with the problem of ventilating railroad tunnels, the author has made available an engineering contribution that has not existed heretofore.

Eugene Murphy.[6] Recently the Chicago newspapers have mentioned experiments made on the New York subways to improve the air flow in the Chicago subway, which is now under construction. Would the author care to comment on the application of his paper to subways in which ventilation depends largely upon piston effect and perhaps slightly on chimney effect, without the aid of fans? In subways, the air velocities past station platforms and upward through sidewalk gratings must be limited to avoid annoyance to patrons, regardless of consideration of friction.

Author's Closure

In reply to Mr. Miles, an investigation was made as to the possibility of ventilating the Moffat Tunnel by the construction of a vertical chimney from near the center of the tunnel to the surface. At the most favorable location the vertical distance to the surface is about 2200 ft. A shaft of this length and 8 ft in diam was estimated to cost about $175,000. However, it is believed that a shaft about 12 ft in diam would really be necessary for satisfactory results, with a corresponding increase in cost.

The temperature in the tunnel is constant at 58 F the entire year while the temperature at the top of the shaft would range from 80 F to below zero. It is believed that under these conditions the chimney could not be relied upon to produce a natural draft upward. In fact it seemed certain that at times there would be a downdraft and at others, no draft at all. Consequently it would be necessary to install a fan at the base of the chimney to insure operation at all times. Thus the scheme seemed to be impractical as a solution of the problem.

It is gratifying to the author that Mr. Van Law has been able

[6] Illinois Institute of Technology, Chicago, Ill.

to add his comments, based upon his observations of the ventilation of the tunnel after the changes in equipment and mode of operation, recommended by the author, had been carried out. The author's paper naturally ended with the analysis of the problem and the prediction of the results that might be obtained with a fan of very different characteristics from the old one, and with a change to blowing air behind a train instead of against it. Mr. Van Law's observations have shown that the predictions were correct, and that a great improvement in tunnel conditions has resulted.

In reply to Mr. Murphy, the ventilation of a subway by the piston effect of the trains without the aid of a fan is a direct application of the case which has been presented in this paper under the heading, "Train Tunnel With Both Ends Open," and illustrated in Fig. 8. Equations [12], [13], and [14] are directly applicable, except that the constant in Equation [13] will have to be changed to conform to the length of a subway section between openings to the outer air, and also modified if the roughness of the walls is materially different from that of the tunnel in question. For a subway, the length involved will be much less than that of the Moffat Tunnel and hence the curve for tunnel friction will have much lower values than those shown in Fig. 8.

Also subway trains will doubtless be shorter than railroad trains and an inspection of Fig. 8 will show that these two effects are such as to provide much less ventilation than in the case of the Moffat Tunnel. As seen by Equation [5], this reduction will be even more pronounced if the subway is a double-track one so that the train does not fill it to the same extent as shown in Fig. 3. Hence piston effect will merely aid subway ventilation but will probably not be adequate.

Developments in Regulating Outlet Valves

By G. J. HORNSBY,[1] DENVER, COLO.

This paper covers briefly the step-by-step progress in the development of high-pressure regulating outlet valves, as experienced by the Bureau of Reclamation. The author describes the various designs of outlet valves now in use, points out some of the good and bad features of present design practice, and proposes some ways and means of preventing cavitation. The conclusions reached are confirmed by model tests. A new and radically different type of regulating outlet valve, which model tests indicate will be free from cavitation and will have unusually favorable stilling-pool characteristics, is described.

OUTLET valves are usually employed wherever water is stored for future use, as for domestic consumption or irrigation purposes. Regulating outlet valves, or gates, are employed wherever regulation, or flow at variable rates, is desired. Regulation of flow by increments is sometimes accomplished by the use of a number of nonregulating valves, or gates, installed in parallel. This method was used at Grand Coulee Dam, which has 60 outlets of the same size installed in horizontal rows of 20 each at three different elevations. By selection of gates and elevations, very close regulation may be obtained.

Storage of water in reservoirs for municipal and irrigation purposes creates the necessity for the outlet valve. In the case of irrigation where water must be released according to current demands to avoid waste, close regulation is highly important. This condition is responsible for the development of the regulating outlet valve. The regulating outlet valve is not only called upon to control the flow of water but to meter it also. With the discharge coefficient of the valve established, the operator is provided with a chart showing the discharge of the valve for various heads and valve openings. From this chart he knows at all times the rate of discharge of the valve.

Need for High-Pressure Regulating Valves

Until about the beginning of the twentieth century, few high-head storage reservoirs were in use. The slide gate is adequate and economical for low-head regulation and hence there was no need for high-head regulating valves. However, when the Bureau of Reclamation came into existence it began to build high-head reservoirs. It was soon found that the slide gate was not practical for high heads due to both extreme hydraulic conditions and mechanical requirements. Friction on the sliding elements and the hoist requirements in many cases were found to be excessive. Also the poor hydraulic characteristics inherent in the slide gates were conducive to cavitation and its destructive effects on the confining walls of the water passages. It was then apparent that a balanced type of valve would be desirable.

Development of Balanced Valve

A crude type of balanced gate known as the cylinder gate had already been developed and used with satisfactory results, but this gate required the use of a hoist for operating. This type of gate is shown in Fig. 1. By means of two clever refinements the cylinder gate was made into the first needle valve to open and close by controlled manipulation of the water pressure from the reservoir. This development was credited to O. H. Ensign in 1906, and may well be regarded as a forward step in the development of balanced needle outlet valves. A flange, or "bull ring," somewhat larger in diameter was added to the head of the cylinder and a conical piece, conforming somewhat to the lines of flow, served to seal the downstream end of the cylinder. This entire assembly became a piston in a fixed cylinder whose machined inside diameter fitted the flange or "bull ring." The reservoir pressure exerted an opening force on the flange at all times, while the controlled pressure inside the fixed cylinder exerted a closing force on the valve which might be greater or less

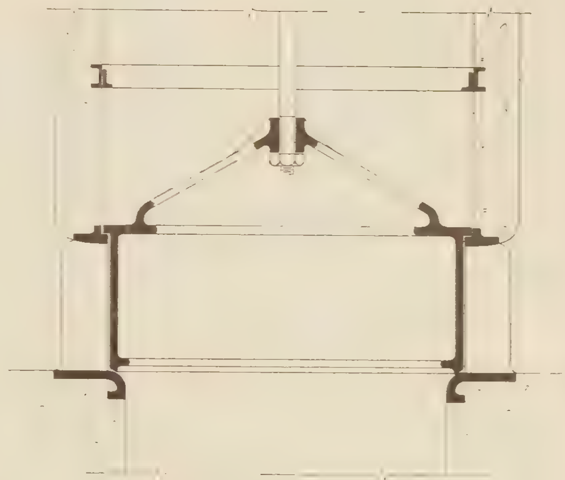

Fig. 1 Typical Cylinder Gate

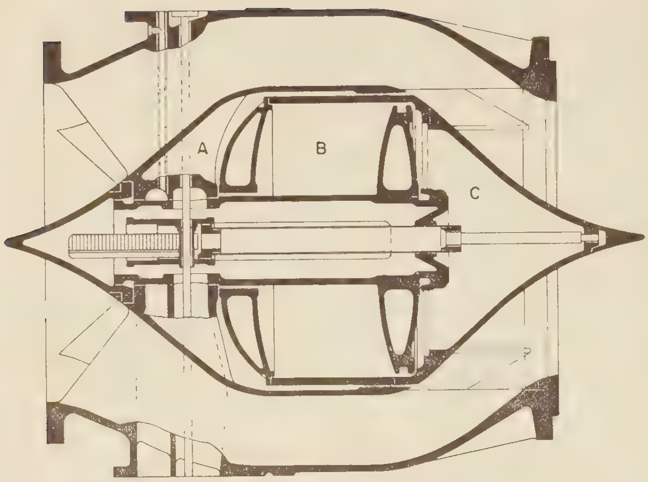

Fig. 3 Internal-Differential Needle Valve

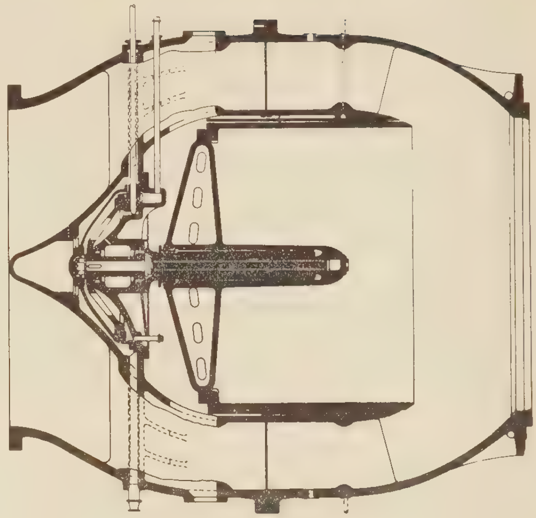

Fig. 5 Tube Valve

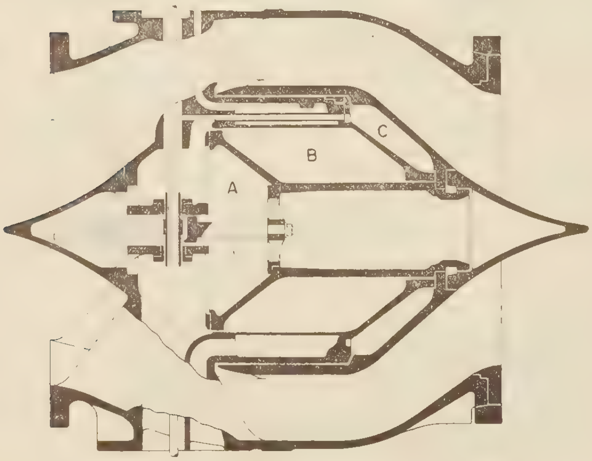

Fig. 4 Interior-Differential Needle Valve

than the opening force. The valve may be held in any position by controlling the pressure in the fixed cylinder. This valve is shown in Fig. 2.

The next development was that of the internal-differential balanced valve. This valve is enclosed in an outer shell, or body, and is designed to be attached to the discharge end of a conduit. The water passages are streamlined throughout and the jet from this valve is intended to be smooth and round, similar to that of the needle valve developed by the Pelton Water Wheel Works for use in connection with the impulse turbine. For this reason the valve is frequently referred to as the needle valve. This valve is operated hydraulically by reservoir pressure acting on pistons within the valve body. The flange or "bull ring" has been turned inward, and a second piston has been added. In this valve the closing force is more than double the opening force. Referring to Fig. 3, it may be seen that chamber A communicates with chamber C so that the force reacting on the upstream cone exerts a force on the piston diaphragm between chambers A and B, and simultaneously the force reacting on the fixed diaphragm between chambers B and C exerts a force on the needle cone for closing the valve. For opening the valve, the force reacting on the fixed diaphragm between chambers B and C exerts a force on the piston diaphragm between chambers A and B. The valve may be held in any position by controlling the pressures in the respective chambers.

Further improvements are embodied in a later design known as the interior-differential balanced valve. The operating mechanisms of this valve are the same as those of the internal-differential valve. The principal difference is in the water passages. It will be seen in Fig. 4 that the supporting ribs between the outer shell and the valve core have been cut back and the valve cylinder slides on the outside of the valve supporting structure. This permits a longer radius for the shoulder between the needle cone and the cylinder to which it is attached. In this design, the outer shell may be made shorter and somewhat smaller in diameter, thus reducing the cost of the valve. The proportions of the water passages are maintained and the flow is not hampered by ribs in the region of high velocity. This results in less pitting on the needle cone and in the valve nozzle.

In an effort to reduce further the cost of balanced outlet valves the tube valve was developed. In this valve, the needle cone and both the fixed diaphragm and the piston diaphragm are eliminated. This, in effect, is the same as the cylinder gate. This type of valve was first operated mechanically by means of a large screw geared within the upstream needle cone and extending downstream through a tube nut in the spider attached to the partially balanced cylinder, as shown in Fig. 5. Later, operation of this type of valve was accomplished by means of a high-pressure oil cylinder attached to the interior of the upstream needle cone and carrying a piston connected to the spider through a piston rod. This design is being developed at the present time for the outlet valves for Shasta Dam.

The various types of balanced valves previously developed were subject more or less to cavitation and pitting, a matter which will be discussed later. Late in 1940, development work on a new and radically different type of free-discharge valve was started in the laboratory. It has been called the "hollow-jet valve," because of its peculiarity of discharging the water in the form of a smooth, hollow cylinder. The interior of this hollow jet requires a surprisingly small amount of aeration to prevent collapse of the jet, for which ample provision is made in the design of the valve. The valve is designed for complete regulation of flow throughout its entire range. Model tests have shown that the jet is smooth and steady, and that the pressure gradient is positive at all points where the water is in contact with the valve for all valve openings. The valve is, therefore, free from

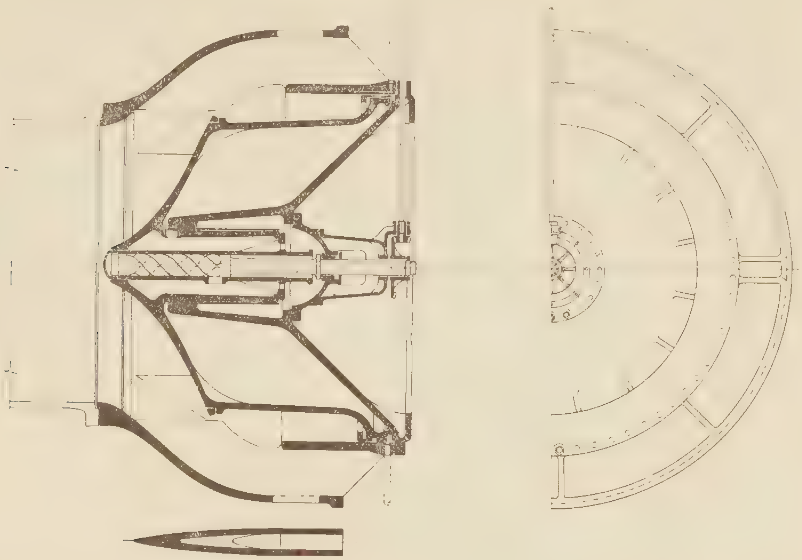

Fig. 6 Hollow-Jet Valve

cavitation and its destructive effects. Regardless of this fact, this valve will discharge a surprisingly large quantity of water for a given size and head. Hence, the cost per cubic foot per second of discharge is small, making it economical to build and install.

Fig. 6 shows the construction of the hollow-jet valve. By removing the smaller circle of flange bolts the spiral control and operating mechanism may be withdrawn for inspection, or by removing the outer circle of flange bolts the entire valve may be dismounted, leaving the valve body undisturbed. Under operating conditions the outer shell is never subjected to greater pressure than that imposed by the reaction of the jet which, by comparison, is small.

Another important feature of the hollow-jet valve is its action on the stilling pool. By making the outer shell of the valve in the form of a slightly diverging cone, the jet will take the form of a hollow cone instead of a hollow cylinder. This will cause the water to be a dispersed instead of a concentrated jet. Obviously this will result in far less erosion in the stilling pool than that produced by the solid jet discharging from earlier types of balanced valves.

Cavitation in Outlet Valves and Conduits

Although cavitation is of great importance in high-head outlet valves and conduits, it appears that little was done about it, especially in the earlier designs. The Ensign valve was de-

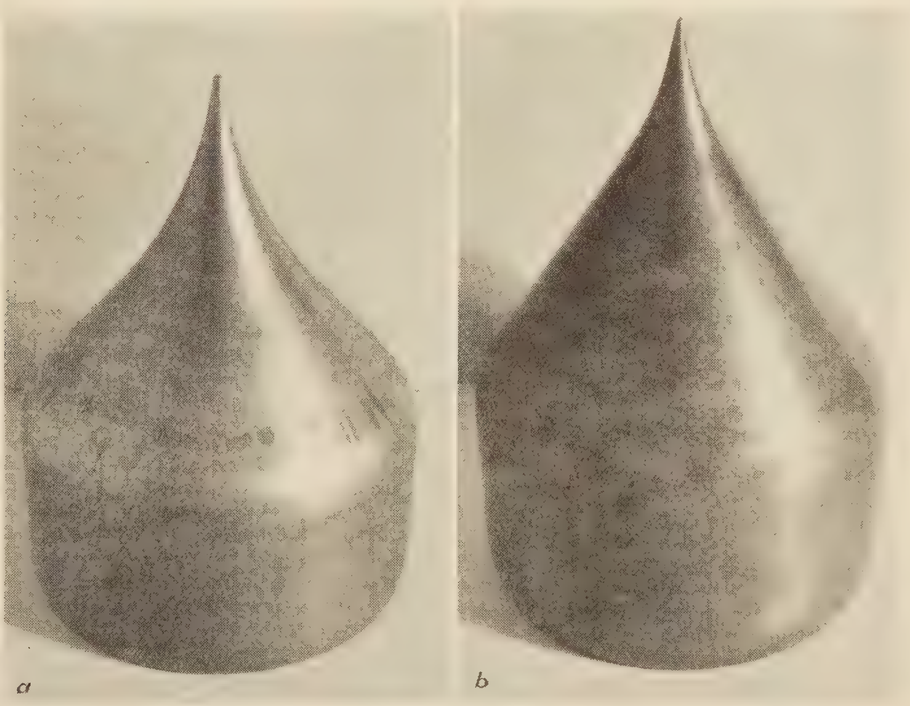

Fig. 7 Pitting in Interior-Differential Needle Valves

(a Pitting on nozzle and needle. b Enlarged view showing extent of pitting.)

signed for use either on the inlet end or the outlet end of the conduit, but was best suited for installation on the inlet end. For that reason most installations were made placing the valve on the upstream face of the dam where the valve acted as a sort of plug for the conduit inlet. For full-discharge conditions the operation was good, but for partial openings the operation was extremely unsatisfactory due to cavitation which resulted in serious pitting on the inner walls of the conduit adjacent to the valve. Attempts were made to admit air to the region of most severe pitting but it was found to be extremely difficult to install an air duct of sufficient capacity in this location after the valves were in place. In fact, it was necessary to lower the reservoir level to a point below the valve before inspection or repairs could be attempted. Regardless of these difficulties a large number of installations of this character were made before it was finally concluded that the outlet end of the conduit was the proper place for the controlled regulating outlet valve.

The internal-differential valve was definitely designed for use on the outlet end of the conduit. Due to the large size and the carefully streamlined water passages of the earlier designs, this valve was comparatively free from pitting. However, in later designs, when an attempt was made to reduce the size and the cost per cubic foot per second discharge, the shorter bends in the water passages resulted in serious pitting. This was also found to be true of the interior-differential type of valve as shown in Fig. 7. However, it is possible to prevent pitting completely, even in the smaller and less costly valves, by the proper application of hydraulic principles as will presently be shown. The hollow-jet valve, designed for large discharges at small cost, embodies these principles and is not expected to have any of the defects found in the earlier types.

In case of the internal-differential-type outlet valves at Boulder Dam and the interior-differential-type outlet valves at Alcova Dam pitting became serious, Fig. 7, and the Bureau of Reclamation initiated a series of investigations to develop corrective measures. Prior to making model tests, a careful study of the hydraulic features of valves was undertaken to determine the cause of the pitting.

Causes of Cavitation

It is not considered necessary to go into a minute discussion of the intricacies of the phenomenon of cavitation and the manner in which it acts upon the confining walls of water passages, as this has been well and fully described and explained by Thomas and Schuleen.[2]

First, a careful study was made of the areas of the cross sections of the water passages at numerous points from the inlet flange to the nozzle of the valve. These areas were plotted against distance along the water passage for valve openings of 10 per cent, 25 per cent, 50 per cent, 75 per cent, and 100 per cent. From the curves, Fig. 8, it was found that at no position of the valve was the minimum, or control section, at the nozzle of the valve. Not only was this true but it was found to change location with each change in position of the valve. An examination of Fig. 8 will show that the control section was farthest upstream when the valve was about 40 per cent open and, as was later shown by model tests, the discharge coefficient was highest at this point. From the point of minimum section to the valve nozzle, the areas increased in the direction of flow in some cases so rapidly that the water could not follow. This produced reduced-pressure areas and cavitation, and pitting resulted in the nozzle and on the needle cone. This was confirmed by tests on models of the valves.

[2] "Cavitation in Outlet Conduits of High Dams," by Harold A. Thomas and Emil P. Schuleen, Proceedings of the American Society of Civil Engineers, vol. 66, 1940, p. 1623.

It was apparent from these studies, that the nozzle and needle cone must be so designed that the minimum or control section of the valve shall be stable, that this control section be located at the lip of the nozzle, and that there be a slight convergence of the water passages as the flow approaches this point. This condition must obtain for all valve openings if cavitation is to be eliminated. It was also apparent that in order to hold the control at one point in the nozzle and meet the stated conditions the nozzle should be sharp-edged.

Another point revealed by the studies was that the seat line on the valve was not on the cone portion of the needle but on the rounded shoulder between the cylindrical needle body and the point of tangency at the needle cone. This caused the water to have a tendency to leave the needle cone at small openings,

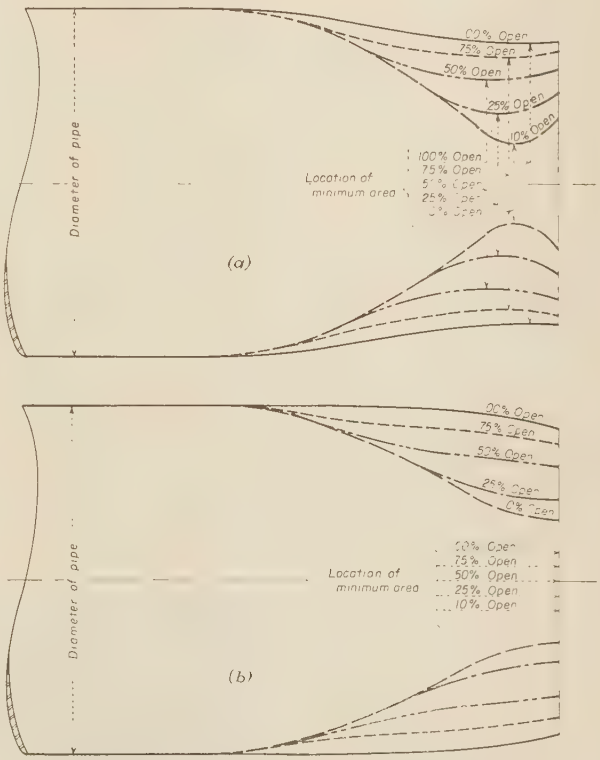

Fig. 8 Equivalent Areas for Various Valve Openings
(a Circular nozzle with areas equivalent to original interior-type needle valve. b Circular nozzle with areas equivalent to improved interior-type needle valve.)

resulting in severe pitting immediately downstream from the seating line in both nozzle and needle cone as shown in Fig. 7. This indicated that the seating line should be on the needle cone proper and not on the curved shoulder between the needle cone and the needle body.

From the studies it was found that, by making the angle of the needle cone the same as, or slightly less than, that of the nozzle cone, there was sufficient convergence in the water passages in the direction of flow to maintain positive pressures throughout the valve for all valve openings. Further, by making the tangent circle between the needle cone and the rounded shoulder slightly larger in diameter than the sharp-edged nozzle, a narrow zone of contact instead of a line formed the valve seat. As the valve is so designed that tremendous pressure is exerted by the valve against the valve seat, the zone or band contact is far superior to the line contact used in former designs. Obviously the relation between the angle of the needle cone and that of the

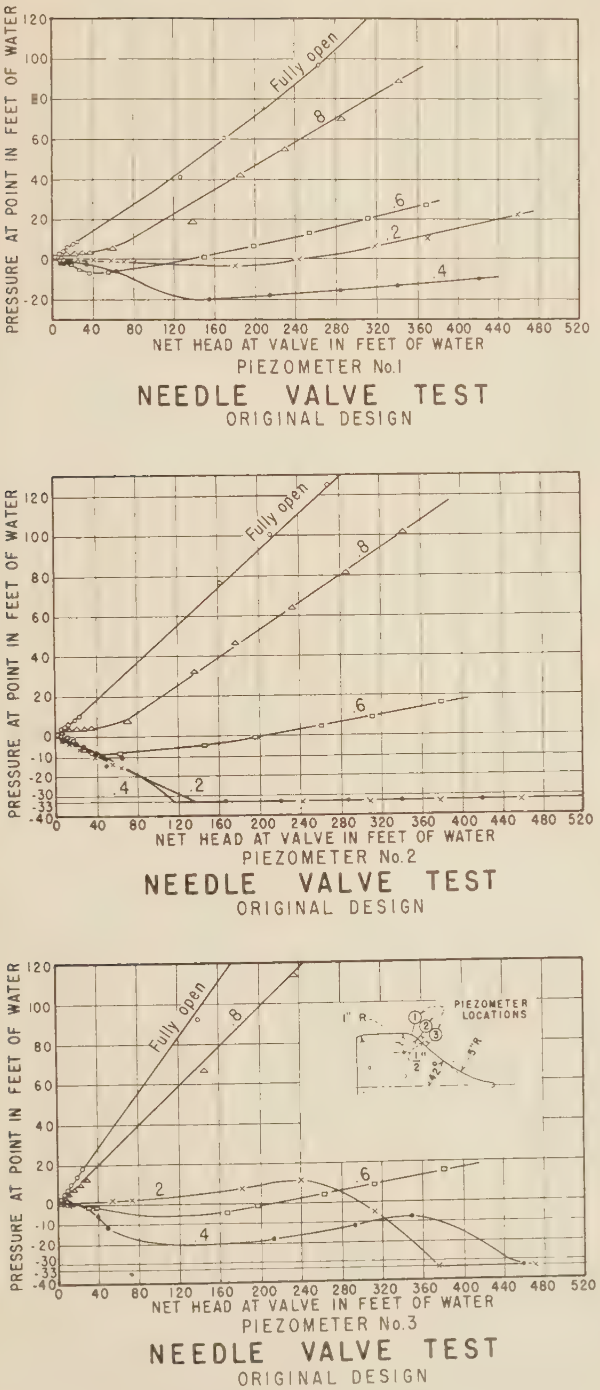

Fig. 9 Pressures on Needle Cone, Original Interior-Differential Needle Valve

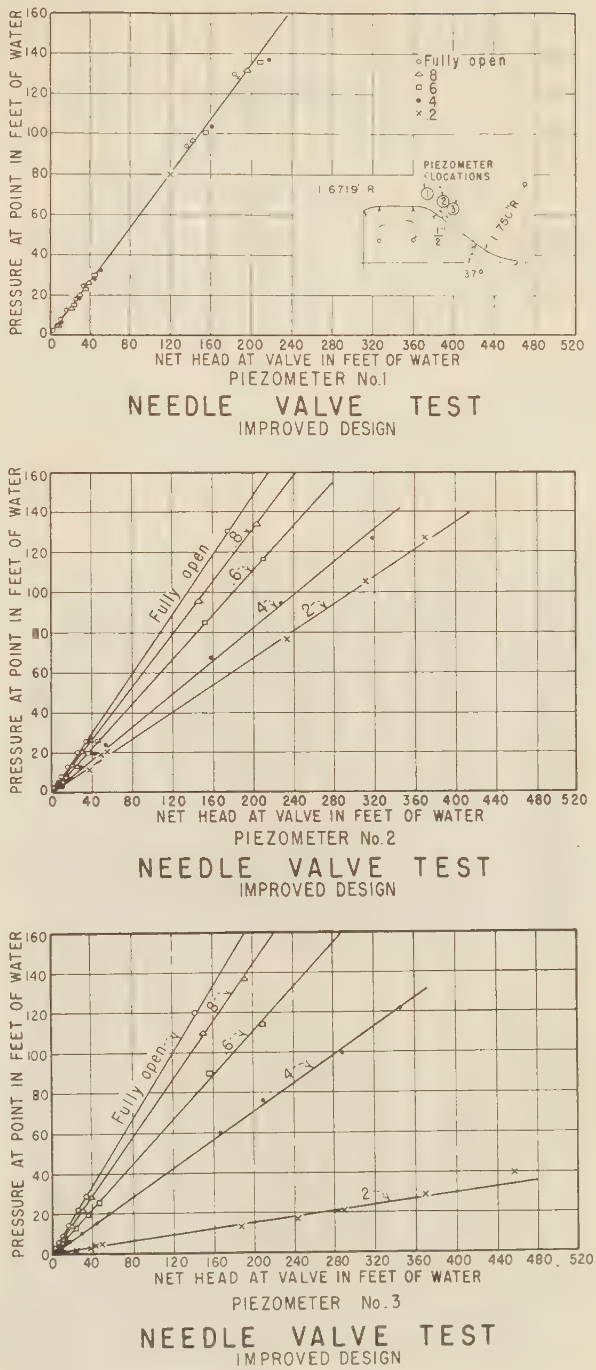

Fig. 10 Pressures on Needle Cone, Improved-Design Interior-Differential Needle Valve

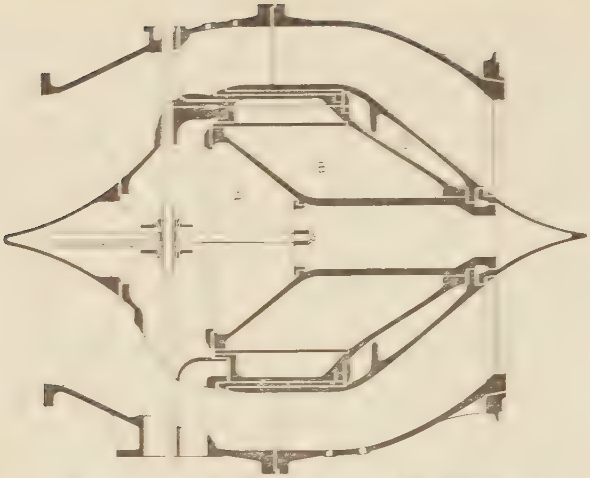
nozzle is of great importance since it determines whether or not the valve will be subject to cavitation. If the angle of the needle cone is greater than that of the nozzle cone there is danger of cavitation but the discharge will be greater. Conversely, if the angle of the needle cone is less than that of the nozzle, the safety factor is increased but the discharge will be less, due to greater convergence of areas in the direction of flow.

Model Studies

In order to test these conclusions, a model embodying these principles of design was constructed of a size to fit on a 6-in. outlet pipe. Having on hand a model of the older design of the same size, the models were tested in exactly the same manner so as to compare results. Pressure piezometers were located on the needle cones of both models as indicated on the curves of Figs.



[illegible]

([illegible] under 500 ft head; *b* improved [illegible] under 500 ft head.)

[illegible]

In [illegible] pressures were indicated [illegible] distance back [illegible] piezometers showed positive [illegible] openings. The location [illegible] for all heads.

In [illegible] nozzle and outer [illegible] Fig. 10.

[illegible] heads of only [illegible] as to what would [illegible] models were then taken [illegible] about 450 ft were available. The models were tested under these heads and the curves, Figs. 9 and 10, were extended accordingly. The lower points on the curves are those obtained in the laboratory and the higher points were obtained from the Boulder Dam tests.

Upon completion of the pressure tests, the model of the original design of the interior-differential valve and that of the improved design were left in operation under a head of about 500 ft. The valves were set at partial openings and were watched for the appearance of pitting. After 14 days, the original design was pitted, as shown in Fig. 12 (*a*), while the improved design showed no pitting after operating for 84 days, as shown in Fig. 12 (*b*).

In an attempt to improve the original design, the rounded nozzle was replaced with a sharp-edged nozzle, after which all the pressure piezometers in the nozzle and outer body of the valve showed substantially positive pressures and the pressures on the needle cone were greatly improved. However, it was still apparent that low pressures would occur in the region of piezometers Nos. 2 and 3 at 0.2 valve opening. It is interesting to note the discharge was reduced about 10 per cent by the sharp-edged nozzle.

In designing the hollow-jet valve, every effort was made to insure positive pressures at every point where the water at high velocities contacted metal surfaces. In other words, the design principles already developed were rigidly observed. A model of the hollow-jet valve was made to fit the same 6-in-diam pipe used for the tests previously described. Pressure piezometers were placed in the line of flow along the surface of the valve cone and along the outer body from the inlet flange to the discharge lip. All showed positive pressures. It is, therefore, concluded that this valve will be free from cavitation.

9 and 10. It should be pointed out that the angle of the needle cone on the original design was 42 deg and that of the nozzle was 36 deg 22 min, Fig. 3, while on the new design the angle of the needle cone was 37 deg and that of the nozzle was 40 deg, Fig. 11.

Pressure piezometers were also placed in the nozzle and along

Summary

The most desirable location for the outlet valve, either regulating or nonregulating, is at the discharge end of the conduit. Regulating valves may be used in a conduit only when adequate air relief is provided for the partially open positions.

Outlet valves of the balanced needle type, the tube type, or the hollow-jet type can be designed to eliminate cavitation by proportioning the water passages so that there will be positive pressures in all regions for all positions of valve opening.

The foregoing conditions can be complied with (1) by designing the nozzle with a sharp edge, (2) by making the base of the needle cone larger in diameter than the edge of the sharp-edged nozzle, (3) by making the angle of the nozzle cone equal to or greater than that of the needle cone. This is true except for the hollow-jet valve, in which case the angle of the nozzle cone must be considerably less than that of the needle cone to produce proper convergence and consequent pressures in the direction of flow.

The Performance of Flat-Plate Solar-Heat Collectors[1]

By H. C. Hottel[2] and B. B. Woertz,[3] Cambridge, Mass.

The great magnitude of solar-energy flux on the earth has stimulated a number of attempts at its more effective utilization during the last 60 years. Mouchot (1, 2)[4] and Pifre (3, 2) in France, Shuman (4) in Egypt, Ericsson (5), Willsie (6), Shuman (7), and more recently Abbot (8) in America are but a few of the names associated with attempts to prove the economic feasibility of converting solar energy to heat and transferring that heat to the working fluid (steam, air, and sulphur dioxide have been used) of a heat engine. Recently Dr. Godfrey L. Cabot has made possible a continuing research on the problem by establishing an endowment at the Massachusetts Institute of Technology for studying means of more effective utilization of solar energy. Four projects are under way: three in the fields of photochemistry, photoelectricity, and thermoelectricity. The fourth follows the conventional attack on the problem, namely, the collection of solar energy in the form of heat in a fluid and the utilization of that heat. The present paper is a first quantitative report on progress in the last field.

SOLAR-HEAT collectors may be classified according to the type of insulation, degree of concentration of sunshine, and nature of orientation (whether, and how completely, they follow the sun). Insulation may consist of one or more spaced glass panes parallel to the absorbing surface of a flat collector, or one or more concentric glass tubes surrounding a heat-absorbing tube, with or without vacuum between the tubes. In the case of the flat-plate collector, the back side is also insulated. Concentration may vary from unity in flat-plate collectors to successively higher values as reflectors are employed in the shape of cylindrical parabolas, truncated cones, or paraboloids. Orientation varies greatly with the type of concentration; it includes stationary horizontal, stationary but tilted toward the equator, mounting on an East-West axis to follow the sun's seasonal motion, mounting on North-South horizontal or equatorial axes to follow the sun's diurnal motion, mounting on two axes, equatorial and transverse, to maintain the collector normal to the solar beam at all times, azimuth mounting, and others.

The engineering literature indicates that most of the possible combinations of insulation, concentration, and orientation of solar-heat collectors have been tried at one time or another. A final decision as to which is best involves quantitative knowledge of performance characteristics, combined with an economic balance of cost versus performance.

[4] Numbers in parentheses refer to the Bibliography at the end of the paper.

Contributed by the Heat Transfer Division and presented at the Spring Meeting, Atlanta, Ga., March 31–April 3, 1941, of The American Society of Mechanical Engineers.

Because flat-plate collectors are the simplest and basic type, because a preliminary analysis indicated that they may have economic importance in connection with solar house heating, air conditioning, or power production, and because they are even now of some importance in connection with the supply of domestic hot water, the present project started with a study of their characteristics.

A flat-plate collector consists in general of an insulated flat absorbing surface painted black to increase absorption. This surface may be a sheet of metal or a number of tubes, with or without fins on their sides. In the case of a sheet-metal absorber, some form of piping is fastened on one side of it so that water or some liquid may be circulated through the piping to collect the heat. Below the absorbing surface some form of insulation is used, such as glass wool, mineral wool, aluminum foil, wood, or dead-air spaces. Desert sand has been tried (6) but found inadequate. Above the absorbing surface is one or more layers of a material substantially transparent to solar radiation, spaced approximately 1 in. apart. Glass has been used exclusively in the past, but certain plastics may be found to work satisfactorily.

A number of flat-plate collectors have been built and described. Tellier (9), in 1885, described a tilted flat-plate-collector system for heating ammonia, in connection with solar water pumping. Willsie (1902–1909) built horizontal flat-plate collectors in Needles, Calif., involving combinations, such as desert sand as an insulator, oil-covered water, water on an asphalt surface with one and with two layers of glass. He used the collected heat for operation of an engine with sulphur dioxide as the working fluid. Shuman, in Philadelphia (1906), built a flat-plate collector, consisting of water-immersed coils containing ether. Insulation consisted of one layer of glass. The ether was vaporized, used to drive a small engine, condensed in an air-cooled condenser, and pumped back into the collector. Flat-plate collectors have been in use for domestic water heating in Florida and California for a number of years. At present there are several companies manufacturing them. Brooks (10) has studied several types of natural-convection solar water heaters in use in California, and gives some quantitative data on performance but no correlation with measurements of solar intensity. Thus, it is seen that previous work on this problem has not yielded quantitative relations for predicting the effects of the many factors which contribute to the over-all performance of a flat-plate collector.

Description of Experimental Setup

An Eppley pyrheliometer (11) of the type installed at some eighteen Weather Bureau stations is in use for determining the rate of reception of total solar radiation on a horizontal surface; it is connected to a recording potentiometer. Although a calibration constant was provided by the Weather Bureau, the pyrheliometer was subjected to a detailed study of response to radiation from a constant source at various angles of incidence. The instrument was mounted equatorially and irradiated by a 1000-w projection bulb at various angles; the absolute calibration was established by comparison with a Smithsonian substandard silver-disk pyrheliometer. The instrument "constant" was substantially constant at 0.925 from normal incidence up to 50 deg, increased slowly to 0.995 at 70 deg, then rapidly to 1.17 at 80 deg

(these values are ratios to the average calibration constant recommended by the Weather Bureau).[5]

The special building constructed for this study consists of a laboratory and small office of approximate ground area 16 ft by 31 ft, Fig. 1, well insulated to compensate for its high surface-volume ratio. The walls are lapped board and plywood inside, paper-sealed, with $3^5/_8$-in. rock-wool bats in the space between joists; windows are double-glazed and weatherstripped throughout; ceiling insulation consists of 4 in. of mineral wool. This construction gives 820 sq ft of wall with a calculated over-all

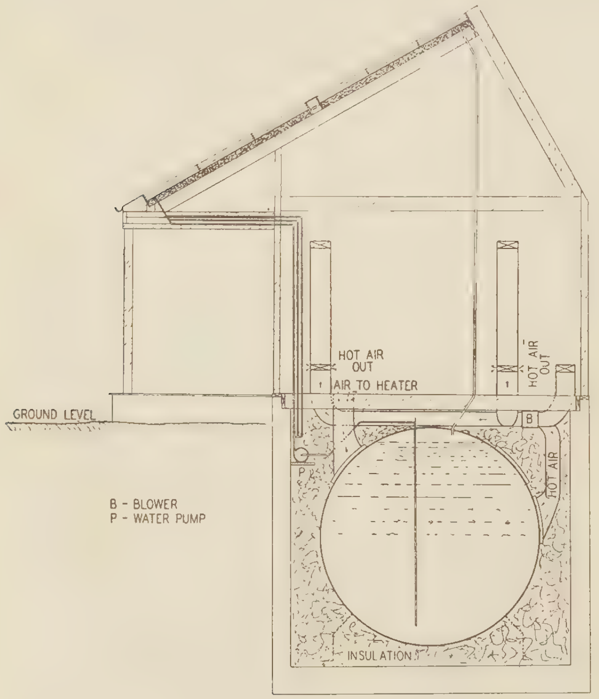

Fig. 1 Sectional View of Solar-Energy Building at the Massachusetts Institute of Technology

coefficient of heat loss, per sq ft, of 0.075 Btu per deg F per hr, 483 sq ft of ceiling with an over-all coefficient of 0.055 Btu per deg F per hr, 75 sq ft of windows with a coefficient of 0.58 Btu per deg F per hr. One air change requires 73.3 Btu per deg F. There is no heat loss but rather a small heat gain through the floor, since the basement is filled with an insulated hot-water tank. In heat required per cubic foot, the building corresponds to a moderately insulated six-room house. Other features of the building were dictated by the intention to use it for studying the performance of various types of solar-heat collectors and the utilization of the heat so collected for house heating, air conditioning, and power generation.

The roof is of a special construction; the greater part of it slopes about 30 deg southward, and is recessed 9 in. deep except for a narrow strip at all edges. The area of the recess is approximately 533 sq ft; at present it is partially filled with 360 sq ft of exposed absorbing surface in collectors occupying 408 sq ft.

The basement is filled with a hot-water tank and insulation. The tank is 11 ft inside diam and 24.5 ft long, having a capacity of 17,400 gal (2320 cu ft). The average thickness of insulation is 2.18 ft; due to its nonuniform distribution around the tank, its effective thickness is 1.96 ft. These data yield a calculated heat loss of 390 Btu per deg-day using a k of 0.022 Btu per deg F per sq ft per hr per ft for the insulation.

The tank is equipped with a calibrated 10-junction copper-constantan differential thermocouple in a glass tube running from the top of the tank to within less than 6 in. of the bottom. The hot junctions can be run up and down the glass tube for a temperature traverse.

Before the space between the tank and the basement walls was filled with insulation, nine thermocouples were placed against the concrete walls, for use in calculating heat losses from the tank.

The size of the tank and the roof-collector area in use in this experimental building are not quantitatively significant for calculation of the cost of solar house heating. The unit is known to be highly uneconomical; its characteristics were dictated by considerations of need for flexibility in application to various problems. Economic studies will come later.

The building is heated by hot air, warmed by passage through a duct system, one side of which is the water-tank wall itself. The ducts, 2 in. by 30 in. in cross section, make three passes lengthwise of the tank and cover a tank area of 155 sq ft. The air fan, controlled by a thermostat, withdraws air from a register in the floor and delivers it through any of eight registers in the partition between the office and laboratory. Four of these are approximately 1 ft above the floor; the others $1^1/_2$ ft from the

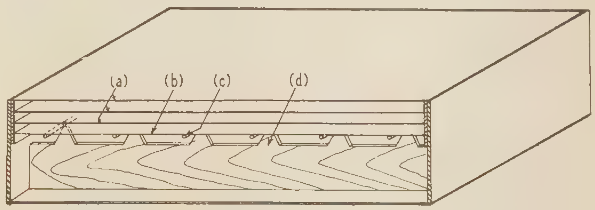

Fig. 2 Cutaway Section of One of the Solar-Heat Collectors Tested

(a Air-spaced glass panes; b blackened-metal absorbing surface; c copper tubes for circulation of water; d wooden cross supports for absorbing surface.)

ceiling. The latter were intended primarily for use with an air-conditioning unit in the summer.

There are fourteen collectors set in the roof recess. A cutaway section of one is shown in Fig. 2. The absorbing surface b is a 3-ft by 9-ft blackened-copper sheet 0.02 in. thick to which are soldered six parallel copper tubes, 0.375 in. outside diam, 0.016 in. wall, spaced 6 in. apart, running lengthwise of the collector, and silver-soldered at their ends into $^3/_4$-in-outside-diam copper header tubes. The absorbing surface is set into a $^3/_8$-in. plywood box, and is supported by side strips and wooden cross supports d. The space between the metal and the box bottom, 5.5 in., is filled with insulation. Above the absorber are three air-spaced layers of double-strength glass of high quality (referred to later as glass C_2), in 3-ft by 3-ft panes. The supports for the glass divide each collector into three square cells. A nonhardening calking compound is used on the top panes.

The collectors are placed seven side by side running up the roof, with seven more above them. Water flows in series through two collectors. The three water-supply lines supply four, four, and six collectors. The water-circulating system, for transfer of heat from the roof to the basement tank, consists of a centrifugal pump withdrawing water from within 1 ft of the tank bottom and discharging it through three lines in parallel for supplying the three sets of collectors on test. Each line is provided with a calibrated thin-plate orifice, connected to a ligroin-water-filled inverted manometer. Except when the water is near its boiling point, the flow rate may be determined to within $^1/_2$ per cent.

From the orifices, the water lines go to the collector inlets along

[5] A more detailed account of the calibration of the instrument appeared recently (21).

the lower edge of the roof. The collector outlets unite in the attic, and the returning water is delivered to the air space in the tank top. All tubing is sloped so that it drains into the tank when the pump is stopped. The pump is controlled by a galvanometer-photocell-relay combination, operated by a differential thermocouple (12), the two junctions of which are in the hot-water tank at the pump-inlet level and on a collector on the roof, respectively.

For measurement of water temperatures, there are five calibrated mercury-in-glass thermometers in use, graduated to 0.1 C and capable of being read to 0.01 C. The thermometers are located in wells at the tank outlet, the farthest collector inlet, and all three collector outlets. In addition, there is an independent system for recording temperature rise in any one of the three collector systems, consisting of resistance thermometers in an unbalanced Wheatstone-bridge circuit, connected to a recording millivoltmeter. The circuit contains actually two of the four resistance thermometers, one in the pump-inlet line and any one of the other three in the outlets from the three collector systems.

Most domestic solar hot-water heaters depend upon natural circulation, with the tank above the collector level. However, if flat-plate collectors ever achieve large-scale importance they will almost certainly be of the forced-circulation type, to which this discussion is restricted.

Experimental Data

The data taken for determining flat-plate-collector performance included the following:

(*a*) A continuous record of total solar radiation on a horizontal surface, determined by the Eppley pyrheliometer; and integration of the record to give hour-by-hour reception.

(*b*) Fraction of total radiation arriving as diffuse or sky radiation. This is based on results of occasionally shading the pyrheliometer from the sun and observing the lowest radiation indicated.

(*c*) Differential pressures across orifices in the water-supply lines of the three sets of collectors, from which flow rates are calculated.

(*d*) A continuous-chart record of temperature rise of the water flowing through one set of collectors, and integration over hourly periods.

(*e*) Readings of calibrated thermometers simultaneously with readings from the chart record (*d*), to determine the correction factor on the chart record; this comparison is made only during periods of steady sunlight.

(*f*) Outside air temperature.

(*g*) Attic and laboratory temperature, necessary for making thermometer-stem corrections.

(*h*) A qualitative estimation of dirtiness of uncleaned collector units. The top panes of glass of the east unit were maintained clean at all times. The west and center units were never cleaned except by rain or snow. Visual observations of dirtiness were recorded day by day in the form of a grading 1 to 5, grade 1 being clean and grade 5 being very dirty; all grading was done by the same individual.

In order accurately to establish the temperature of the collector plate, known to be a major factor in determining efficiency, the water rate was kept high enough to prevent a temperature rise in excess of 15 F. The collector temperature was taken as the arithmetic-mean water temperature.

A discussion of the results of many runs summarized in Table 5 must wait for an analytical treatment of the problem. Other data on transmittances and reflectivities of various materials for sunlight will be discussed in this paper under their proper heads.

Analysis of Collector Performance

The problem is to express the rate of useful-heat collection in the water stream in terms of the intensity of sunlight, air temperature, tilt of the collector plate, and properties of the collector parts. Pyrheliometric records most commonly available give the solar-energy flux density on a horizontal surface; call this H_S in cal per sq cm per hr. A portion of the energy comes from the entire sky rather than directly from the sun; call this diffuse-radiation flux density H_D. Then in unit time a unit surface, tilted somewhat toward the equator and covered with severa glass plates, will absorb as direct radiation the amount

$$(H_S - H_D)(\cos\theta_T/\cos\theta_Z)\tau\alpha \equiv (H_S - H_D)R\tau\alpha \qquad [1]$$

where

θ_T and θ_Z = angles of incidence of direct sunlight on a tilted surface and on a horizontal surface, respectively (the latter is generally called the zenith angle of the sun)

τ = over-all transmittance of glass plates for direct solar radiation

α = absorptivity of the blackened collector surface for incident solar radiation

R = $(\cos\theta_T/\cos\theta_Z)$, the ratio of direct radiation intercepted by a tilted surface to that intercepted by a horizontal surface (the pyrheliometer)

A corresponding term $H_D R'\tau'\alpha'$ represents the contribution of diffuse solar radiation to the energy absorption by the collector plate; the primes differentiate the terms from similar ones for direct solar energy. The term R', representing sky radiation on a tilted surface relative to that on a horizontal one, is difficult to evaluate exactly. The incomplete "view" which the tilted receiver has of the sky is partially compensated by its being better oriented with respect to that brighter part of the sky which is near the sun. Because of inadequate knowledge of the distribution of sky radiation, the compensation will be assumed perfect, i.e., $R' = 1$. Diffuse radiation being less important than direct radiation this assumption is usually a minor source of error. The total absorbed energy q_A is now given by the relation

$$q_A/A = 3.69\ [(H_S - H_D)R\tau\alpha + H_D\tau'\alpha'] \qquad [2]$$

The factor 3.69 is introduced to convert H from the units in which it is generally reported in Weather Bureau tables (cal per sq cm per hr) to English engineering units, Btu per sq ft per hr.

The energy q_A/A absorbed by the collector is available for transfer as useful heat q_U/A in a fluid stream in contact with the plate, for supplying the heat loss q_L/A from the plate through the air and glass layers to the air above, and for supplying the heat loss q_B/A from the plate through the insulation below it and out through the bottom of the box (temporarily, a system with no side losses is being considered). The useful heat-collection rate is then

$$q_U = q_A - q_L - q_B \qquad [3]$$

and the problem is the evaluation of q_L/A, q_B/A, and the terms in Equation [2] giving q_A/A.

Solar Radiation on Tilted Surfaces

The total solar-energy intensity H_S on a horizontal surface is recorded at some eighteen stations in the United States. These recorded values are adequate for collectors located near the pyrheliometer; for other sections of the United States, few data are available. The use of data for another locality is at best an approximation. Cloudiness measurements are the most common of all those related to solar radiation and are perhaps the best criterion for selecting the station whose solar-radiation values are most nearly like those, of unknown magnitude, of the locality in

TABLE 2 NUMBER OF CLEAR DAYS DURING PERIOD AUGUST 1–31, 1938;[a] SEPTEMBER, 1939–JULY, 1940

Location	Number
Boston, Mass	105
Williston, N. D	165
Portland, Me	170
Yuma, Ariz	287

[a] August, 1939, data were incomplete; August, 1940, not available at time table was prepared.

question. Summaries of average daily radiation at each of eighteen stations and cloudiness at approximately 200 United States cities and towns appear in the *U. S. Monthly Weather Review*. The complete hour-by-hour records of the eighteen solar stations are obtainable from the stations or from Solar Radiation Investigations, Blue Hill Observatory, Milton, Mass., on payment of the charge for photostating. Although the use of pyrheliometer data from a station having about the same latitude and cloudiness characteristics as the locality of interest may introduce considerable error, there is no better procedure except the installation locally of some type of pyrheliometric equipment.

Cloudiness as a function of season is shown in Table 1 for the region of each solar-radiation-measuring station. Three other localities are also included. It is seen that the period February to April is, in general, the cloudiest, while August to October is the clearest.

For purposes of comparison, the number of reported clear days in a year at Boston and three other localities is compiled in Table 2. It is seen that the percentage of clear days varies from 29 in Boston to 78 in Yuma. The percentage of possible sunshine is considerably higher.

The magnitude of solar radiation on a horizontal surface is shown by the fact that, during the year ending June 30, 1940, a total of 123,300 cal per sq cm (454,000 Btu per sq ft) was received at Cambridge, Mass. About 192,000 cal per sq cm would have been received with no clouds and high atmospheric transmissivity throughout the year. Hourly radiation as high as 93.4 cal per sq cm has been observed.

Data on diffuse, or sky, radiation H_D are rather meager, generally having been measured on relatively cloudless days by investigators not interested in the present use of the data. Values of 4 to 18 cal per sq cm per hr are reported for clear days (13), and indications are that sky radiation is relatively constant throughout most of the day. Measurements made at Cambridge between March 18 and June 30, 1940, in connection with the present project, indicate an average value of H_D of 16.3 cal per sq cm per hr for all hours in which heat could be collected at the prevailing tank temperature. For 0.5, 1.5, 2.5, 3.5, and 4.5 hr from solar noon, the corresponding average values of H_D were 18.2, 16.9, 16.7, 14.3, and 9.7 cal per sq cm per hr. During December, 1940, the values of H_D at 0.5, 1.5, and 2.5 hr from noon were 7.8, 7.7, and 6.

Diffuse radiation is highest on partly cloudy days and lowest on very cloudy days, extreme values of 52.7 and 1.5 cal per sq cm per hr having been recorded at the Cambridge station. The average noon value for days on which heat could be collected is around 20 cal per sq cm per hr at the summer solstice and 8 at the winter solstice. It is believed that summer-solstice values are proper to use until the latter part of August, since there are as many partly cloudy days in July and August as in June. On a cloudless day H_D probably averages not more than 9 cal per sq cm per hr, even in the summer.

The geometrical factor R involves the latitude ϕ, the tilt β of the collector from the horizontal toward the equator, the declination δ of the sun, and the time of day expressed as hour angle ω of the sun from the noon meridian (substantially 15 deg per hr). The zenith angle of the sun (14) is given by

$$\cos \theta_Z = \sin \phi \sin \delta + \cos \phi \cos \delta \cos \omega \quad [4]$$

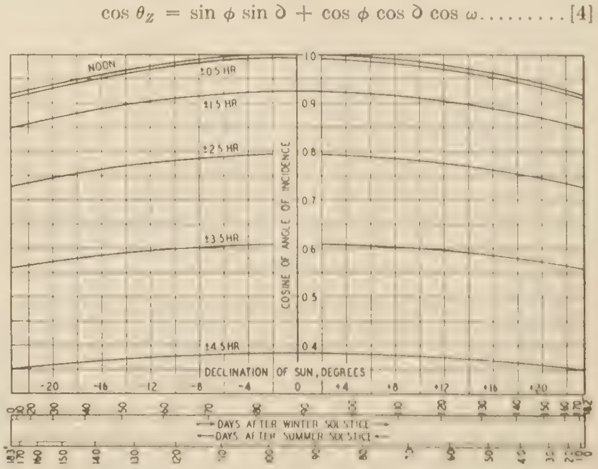

Fig. 3 Cosine of Angle of Incidence of Direct Sunlight on Collectors Tilted β Deg Toward Equator at Latitude ϕ Deg, When $\phi - \beta = 0$ Deg

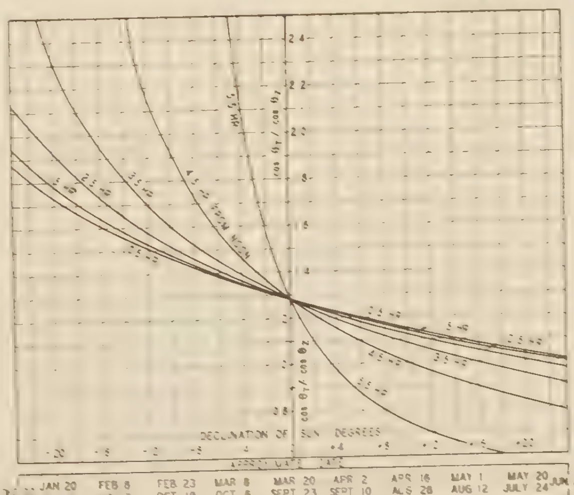

Fig. 9 Cos θ_T/Cos θ_Z, Ratio of Direct Sunlight Falling on a Collector Tilted 30 Deg Toward Equator to That Falling on a Horizontal Collector, Both Being at 40 Deg Latitude

A little consideration will show that the angle of the sun θ_T on a surface tilted β deg from the horizontal toward the equator is the same as on a horizontal surface at an artificial latitude $(\phi - \beta)$. Values of cos θ_T are given in Figs. 3 to 8 for values of $(\phi - \beta)$ in 10-deg intervals from 0 to 50 deg, for times of day corresponding to centers of successive hours from solar noon.

Reading from two of the plots, values may be obtained for cos θ_T and cos θ_Z and their ratio R for various combinations of latitude and tilt. One such combination, latitude 40 deg and tilt 30 deg, appears as Fig. 9. Such a plot serves to emphasize the gain from tilting, during the winter months, and the loss during the summer months because of so large a tilt. It is obvious that the choice of tilt is profoundly affected by whether a collector is to be used to supply heat for an absorption-refrigeration cycle for summer cooling or to heat a house in winter.

Transmission of Radiation Through a System of Glass Plates

The next factor appearing in Equation [2] is the over-all transmittance τ of the glass plates for a beam of solar energy. This depends upon surface reflection and internal absorption in the glass, and both of these depend upon angle of incidence of the beam. Consider first the surface-reflection losses in a system of nonabsorbing glass plates. The reflectivity of an optically smooth nonconductor is given in terms of angle of incidence θ and refractive index n by the Fresnel equations (15). The incident beam is split into its components of polarization, parallel and perpendicular to the plane of incidence, and each component is treated separately. Consider a unit beam, one component of polarization, having a reflectivity of r as calculated previously, and let it be incident on the first surface of the system of parallel plates. The fraction $(1 - r)$ is incident on the second surface. Of that beam, the fraction $r(1 - r)$ is lost back through the first surface, $(1 - r)$ is transmitted through the second surface, and the remainder repeats its division between the two sinks in the same ratio. Then the total amount getting through is

$$(1 - r)\frac{(1 - r)}{(1 - r) + r(1 - r)} \equiv (1 - r)/(1 + r) \equiv \tau_1$$

where τ_1 is the over-all transmittance of a pane of glass, allowing for reflection losses only. To consider two glass panes, let the over-all reflectivity of the first pane $= \rho_1 \equiv 1 - \tau_1$. By analogy to the previous derivation, the over-all transmittance of the two panes is

$$\tau_2 = \frac{1 - \rho_1}{1 + \rho_1} = \frac{1 - r}{1 + 3r} \qquad [5]$$

Extension of this treatment yields the over-all transmittance τ_n of an n-plate system, containing $2n$ reflecting surfaces. It is

$$\tau_n = \frac{1 - r}{1 + (2n - 1)r} \qquad [6]$$

This relation, with values of r from the Fresnel equations, is valid for either component of polarization. For a homogeneous beam (i.e., one with equal values of the two components of polarization), such as direct sunlight, the over-all transmittance is obviously the arithmetic mean of the two values of τ_n calculated from Equation [6].

Over-all transmittance (allowing for reflection losses only) has been calculated by this method and is plotted in Fig. 10, versus angle of incidence for one to four panes of glass of refractive index $n = 1.526$, the value at the D line for the glass used in the collectors tested. The transmittance is seen to vary but slightly for angles of incidence up to 30 deg. It is interesting to note that, for a large number of plates, the over-all transmittance actually increases with angle of incidence out to a value near the critical polarizing angle.

To determine the effect of the combined losses, due to reflection and internal absorption, on the over-all transmittances of various available glasses and partially transparent organic films, a one-junction thermopile was used in a series of measurements of an orienting character. The thermopile, suitably enclosed in concentric chambers for stability of reading, was pointed at the sun and its shutter alternately opened and closed every 20 sec. Open-shutter periods were alternately with and without the glass-plate or organic-film system between the thermopile and the sun. Even with a fairly unsteady solar irradiation, it was possible to obtain quite reliable and reproducible determinations of transmittance, provided several readings were averaged. The accuracy of the method was checked by replacing the thermopile by a Smithsonian silver-disk pyrheliometer, which indicated on one specimen an over-all transmittance of 0.76, compared to 0.755 by the thermopile. The results of such studies of various materials, four air-spaced parallel plates unless otherwise indicated, appear in Table 3. Notable is the variation among available window glasses, due probably to differences in iron content. Glass high in iron is greenish in tinge and in addition is a poor solar-radiation transmitter because of absorption in the near infrared. The glass finally chosen for construction of collectors was that designated by C_2, a rather expensive glass chosen on the ground that, if the demand were great enough, similar glass could be manufactured which would lie in the window-glass price range. Plate glass was used, not because the grinding operation added value to it for the present use, but because a supply of seconds was available.

Since transmittance for a normal beam of solar energy is inadequate for collector design, a more comprehensive study was made of glasses A_2 and C_2, to determine internal absorption versus thickness. Layers of glass were cemented together with a balsam-benzene mixture, the absorptivity of which for solar radiation was found to be low enough to justify a simple correction for it. (Extinction coefficient was 10 times that of glass C_2, 2.5 times that of glass A_2; equivalent thickness, expressed as glass, never exceeded 5 per cent of glass C_2.) When the data are plotted as transmittance on a log scale versus sample thickness on an arithmetic scale, a sufficiently straight line is obtained to justify the use of the conventional exponential relation, strictly applicable only to monochromatic radiation. Smooth curves indicated transmittances for 0.5 in. of glasses C_2 and A_2 of 0.948 and 0.806, respectively, when reflection loss was eliminated. Extinction coefficients K equivalent to these values are 0.107 in.$^{-1}$ (0.042 cm^{-1}) and 0.432 in.$^{-1}$ (0.170 cm^{-1}), respectively, for use in the relation

$$\tau_a = e^{-KL} \qquad [7]$$

where τ_a is the transmittance of thickness L, allowing only for internal absorption losses in the glass.

With knowledge of extinction coefficients applicable for total solar radiation, it is possible to calculate the over-all transmittance τ of a system of plates. Stokes (16) treats this problem of the combined effects of multiple reflection and internal absorption. To a high degree of accuracy, however, τ is given by the simple relation

$$\tau = \tau_r \cdot \tau_a \qquad [8]$$

where τ_r and τ_a are, respectively, the transmittance of the plate system, allowing for reflection losses only (Fig. 10), and the transmittance, allowing for internal absorption only. The simplified relation will break down when τ_r and τ_a are far from unity, but introduces an error of less than 1 per cent in the range of interest in collector design.

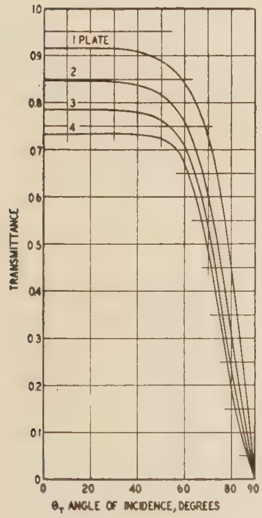

FIG. 10 CALCULATED TRANSMITTANCE τ_R OF A SYSTEM OF GLASS PLATES, ALLOWING FOR REFLECTION LOSSES ONLY

(Refractive index = 1.526.)

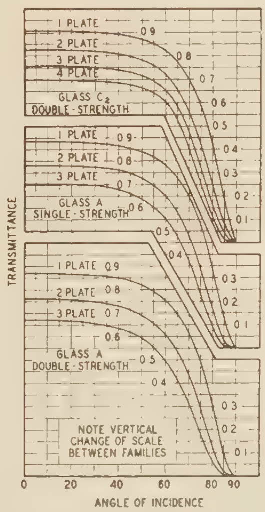

FIG. 12 TRANSMITTANCE τ OF SYSTEMS OF GLASS PLATES, ALLOWING FOR REFLECTION AND ABSORPTION LOSSES

(Top, middle, and bottom families are for glasses with KL per plate = 0.0125, 0.0370, and 0.0524, respectively.)

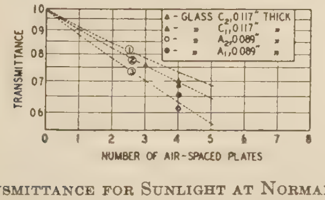

FIG. 11 TRANSMITTANCE FOR SUNLIGHT AT NORMAL INCIDENCE, OF PLATES OF VARIOUS GLASSES

(Data points experimental, smooth curves calculated. Curve 1 allows for reflection losses only; n = 1.526. Curves 2 and 3, for glasses C_2 and A_{avg}, allow for the effects of absorption and reflection. K = 0.107 in.$^{-1}$ and 0.419 in.$^{-1}$, respectively.)

Fig. 11, shows experimental points for the glasses A and C taken from Table 3, subscripts referring to samples from different batches. The glass used in the roof collectors was C_2. Attention is called to the considerable difference between the two samples of glass A. In the same figure appear some calculated curves for comparison. Curve 1 gives the transmittance τ_r of a nonabsorbing glass of refractive index n = 1.526 (applies to glass C and approximately to glass A); curve 2 is curve 1 multiplied by τ_a for the proper total thickness of glass C_2, using the previously determined extinction coefficient of 0.107 in.$^{-1}$; curve 3 is curve 1 multiplied by τ_a for the proper total thickness of glass A, using an extinction coefficient of 0.419 in.$^{-1}$ to make the curve go midway between the results for the two samples of glass A.

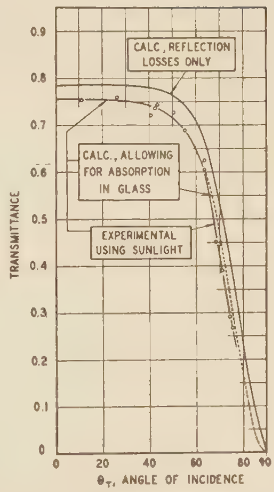

FIG. 13 TRANSMITTANCE OF THREE PLATES OF GLASS C_2, AS USED IN COLLECTORS TESTED

(Appropriate calculated curve from Fig. 12 and one from Fig. 10, allowing for reflection losses only, also shown.)

Using the extinction coefficients 0.107 in.$^{-1}$ and 0.419 in.$^{-1}$ for glasses C and A, respectively, and a refractive index of 1.526, over-all transmittances were calculated for systems consisting of one to four plates of double-strength glass C and one to three plates of single- or double-strength glass A. The results are given in graphical form in Fig. 12. Four panes of double-strength glass C transmit more than three panes of single-strength glass A or about as much as the average of two and three panes of double-strength glass A.

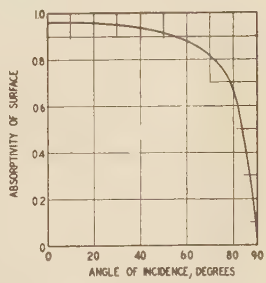

FIG. 14 ABSORPTIVITY OF A BLACKENED SURFACE FOR ARTIFICIAL SUNLIGHT TRANSMITTED THROUGH GLASS

(From reference 17 of Bibliography.)

As a final check on the calculated over-all transmittance of glass C_2, several determinations of τ for various angles of incidence were made using three panes of glass. In these measurements, the glass was maintained either horizontal or parallel to the roof, and variations in angle of incidence depended upon variation of position of the sun in the sky. The data are shown in Fig. 13, together with the calculated curve from Fig. 12 and a curve allowing for reflection losses only from Fig. 10. The agreement between the calculated curve and experimental data is excellent out to an angle of 65 deg. The small discrepancy at greater angles may well be due to the change in the quality of solar energy when the sun is low; an increase in the fraction of the energy in the infrared, which is most easily absorbed by glass. There is no indication from this study, however, of any need for complicating the problem of collector performance by attempting to allow for the effect of change in quality of solar energy.

ABSORPTIVITY OF BLACKENED SURFACES

The next factor in Equation [2] to be considered is the absorptivity α of the blackened collector plate for solar energy. The variation of α with angle of incidence of the beam has been

determined by the British Building Research Board (17) using a filtered-light source in imitation of sunlight. The results are given in Fig. 14. To obtain as perfect an absorber as possible, the monochromatic absorptivities of a number of surfaces covered with various mixtures of carbon black and vehicle were determined, using the Hardy spectrophotometer. An absorptivity in the visible spectrum of 98+ per cent at normal incidence is easily obtainable with blacks in which a minimum of vehicle is used, but adherence to the metal plate is poor.

The collectors under study were blackened with one coat of a primer consisting of 1 part by weight of special carbon-black pigment to 2 parts of alcohol-resisting varnish. The top-coat composition was 2.5 parts of the same pigment per part of 4 lb cut shellac. Enough thinner was added to reduce the paints to a thin brushing consistency. Test pieces finished with these had an absorptivity of 98.8+ per cent; but upon application to the collector surface, the paint had a definite tendency to crack and curl. This condition was not regarded as serious, and has become no worse since. However, due to the imperfection of the coat on the collectors, a value of 0.98 at normal incidence was judged to be sufficiently high for the finished collectors. Values at other angles of incidence were taken as 0.98/0.96 times the values read from Fig. 14.

Although not actually measured for absorptivity, test pieces later finished with drop black showed definitely superior adhesion characteristics of the paint and at the same time appeared to have substantially as high absorptivity.

The question arises as to what values to use for τ' and α', the transmittance and absorptivity for diffuse radiation. If one assumes a uniform sky, a graphical integration is possible which indicates that sky radiation is transmitted by three glass plates (C_3) and absorbed by the blackened surface as though it were all concentrated in a beam making an angle of 58 deg with the normal to the collector. For the present collector system, the corresponding value of $\tau'\alpha'$ is 0.61.

Heat Losses From Absorbing Surface to Atmosphere

The next factor to be considered is the upward heat loss q_L. Inasmuch as the absorption of solar energy within the glass plates covering the blackened metal surface of the collector is small, the loss of heat upward from the collector metal maintained at a definite temperature by circulating water may be calculated independently of the influx of solar radiation. Variables determining the upward heat flux are (*a*) temperature of the absorbing surface; (*b*) temperature of the outer air and sky; (*c*) number of glass plates and spacing; (*d*) tilt of the glass plates from the horizontal; and (*e*) wind velocity over the top plate.

The first four items are important in all cases. Wind velocity is important for collectors having one glass plate, less so for others. To prevent excessive complications, the relation for prediction of heat loss will be derived for a collector in steady-state operation and having no side losses. The effect of unsteady operation will be considered later; the effect of side losses can be allowed for independently of the present derivation.

The loss from the collector to the bottom glass plate is by radiation and convection. No radiant heat is transmitted through the glass since the latter is opaque to the long wave lengths characterizing radiation from sources at only a few hundred degrees Fahrenheit. The same quantity of heat is transferred through the glass, thence from its top face to the next plate, by radiation and convection. A preliminary calculation shows that thermal resistance within a glass plate is negligible compared with plate-to-plate resistance; consequently, a mean temperature may be assigned to each glass plate. Since air is diathermic to radiation, the loss of heat by convection from a plate to an air space equals the loss by convection from the air space to the next higher plate. The heat flux q_c/A by convection per sq ft of the collector surface to the bottom plate is given by

$$q_c/A = h(T - T_1) \qquad [9]$$

where T and T_1 are the temperatures of the collector and the first glass plate, respectively. Convection coefficients h for transfer between parallel tilted plates are given by the relation

$$h = c(T - T_1)^{1/4} \qquad [10]$$

where c is a constant dependent upon the tilt (referred to later). The total rate of heat loss q_L/A per sq ft from metal to first glass is then

$$q_L/A = c(T - T_1)^{5/4} + \frac{\sigma(T^4 - T_1^4)}{\dfrac{1}{\epsilon_C} + \dfrac{1}{\epsilon_G} - 1} \qquad [11a]$$

where σ is the Stefan-Boltzmann constant, 0.1723×10^{-8} Btu per sq ft per hr per deg R^4, and the denominator of the second term allows for the effect, on radiant interchange between parallel plates, of the emissivity (and low-temperature absorptivity) ϵ_C of the collector surface and ϵ_G of the glass plate.

The same heat flux q_L/A occurs from the first to the second glass plate

$$q_L/A = c(T_1 - T_2)^{5/4} + \frac{\sigma(T_1^4 - T_2^4)}{\dfrac{2}{\epsilon_G} - 1} \qquad [11b]$$

Similar relations hold up to the top or nth glass plate, but the formulation of the loss q_L/A from the top plate to the atmosphere is different, because convection loss is related to wind velocity and outer-air temperature T_a, and radiation loss is related to the effective radiation temperature of the sky. If, in the absence of adequate data on the latter, one uses air temperature instead, the error in q_L/A is small, particularly if the convection coefficient h_w due to wind is fairly high. Then

$$q_L/A = h_w(T_n - T_a) + \sigma\epsilon_G(T_n^4 - T_a^4) \qquad [11\ n + 1]$$

Given the collector temperature and air temperature, there are $(n + 1)$ Equations [11] in $(n + 1)$ unknowns (n unknown glass temperatures T_1 ..... T_n, and q_L/A), and solution for q_L/A is possible. The solution, however, is a very tedious stepwise trial and error, best accomplished by assigning values to q_L/A and T, calculating T_1 from Equation [11*a*], then T_2 from Equation [11*b*], etc., until T_a is found. If the emissivity factor F_ϵ were the same in all Equations [11], and the convection coefficient were always $c(T_n - T_{n+1})^{1/4}$ (even at the outside of the top plate), then the $(n + 1)$ Equations [11] could be added and divided by $(n + 1)$ to give

$$q_L/A = \frac{c}{n+1}(T - T_a)^{5/4} + \frac{F_\epsilon}{n+1}\sigma(T^4 - T_a^4) \qquad [12]$$

This relation was used as a guide in seeking another, necessarily considerably more complicated and necessarily approximate, which is free from the restrictions on Equation [12]. Such a relation is

$$q_L/A = \frac{T - T_a}{\dfrac{n}{c\sqrt[4]{\dfrac{T - T_a}{n+f}}} + \dfrac{1}{h_w}} + \frac{\sigma(T^4 - T_a^4)}{\dfrac{1}{\epsilon_C} + \dfrac{2n + f - 1}{\epsilon_G} - n} \qquad [13]$$

Although this relation may appear to be rather complicated, it is the only one the authors found which fits the exact relations of Equations [11] over the full range of variables one may expect

to encounter in solar collector design, and it is enormously simpler than the solution of simultaneous Equations [11]. The term f in Equation [13] represents the ratio of thermal resistance of the outer plate to that of an average inner plate. Consequently, its value varies with wind velocity as that affects h_w. For values of h_w of 1, 4.07, and 7, corresponding to winds of 0, 10, and 20 mph (18), values of f of 0.76, 0.36, and 0.24, respectively, are recommended. Since the effect on q_L/A of varying h_w and f is rather small for collectors having more than one glass plate, one is jusfied in using constant values corresponding to a 10-mph wind, which is close to the average for most of the United States.

The adequacy of Equation [13] as a substitute for Equations [11a] to [11 $n + 1$] was tested over the normal range of variables involved; the maximum difference was 1.8 per cent, the average 1 per cent. When ϵ_C is changed from 0.95 (the emissivity of a normally well-blackened surface) to 0.48 (of interest only if such a surface could be found which were at the same time a substantially perfect absorber of sunlight), the error due to use of Equation [13] may increase to 5 per cent.

Equation [13] involves a constant c from Equation [10] giving the convection coefficient for transfer between parallel tilted plates; and the question arises as to its numerical value. The results of various investigations (19) studying heat transfer from hot plates at temperature T_1 to air at T_a conform to the relation

$$q/A = c'(T_1 - T_a)^{5/4} \qquad [14]$$

and are in substantial agreement as to the value of c' for vertical plates, 0.3 when temperature is F. For horizontal plates losing heat upward, the agreement is not good, values of c' varying from 10 to 55 per cent higher than for vertical plates. If one may assume this to hold for the collector system of present interest and to be applicable to transfer both from a plate to air and from the air to the next plate at T_2

$$q/A = c'(T_1 - T_a)^{5/4} = c'(T_a - T_2)^{5/4} \qquad [15]$$

from which

$$T_1 - T_a = T_a - T_2 = \frac{T_1 - T_2}{2}$$

Then

$$q/A = \frac{c'}{2^{1.25}}(T_1 - T_2)^{1.25} \equiv c(T_1 - T_2)^{1.25} \qquad [16]$$

Corresponding to the values given for c', c is 0.126 for vertical and 0.139 to 0.195 for horizontal parallel plates. Such a treatment of the problem is hardly justifiable, however, because of the effect of the closed system in changing the air-flow pattern. Fishenden and Saunders (19) have compared the data of various investigators on heat flow across an air gap between vertical plates (enclosed at all edges) and recommend Equation [16] with $c = 0.126$ (equivalent to $c' = 0.3$). For horizontal plates they recommend $c = 0.16$ (equivalent to $c' = 0.38$) when the spacing exceeds 2 in. Mull and Reiher's data on horizontal parallel plates (19) indicate an increase in heat transfer by convection of 10 per cent when plate spacing is decreased from 2 in. to 1 in. (the value used in the collectors under consideration).

Wilkes (20) on the basis of a more comprehensive experimental study of flow across an enclosed air gap recommends values for c of 0.18, 0.207, and 0.256 for plates which are vertical, tilted 45 deg with heat flow upward, and horizontal with heat flow upward, respectively. Fig. 15 gives values for c recommended by Wilkes, and by Fishenden and Saunders on the basis of experiments of Mull and Reiher.

Since the spread in recommendations for c is considerable and since neither set of experiments corresponded very closely to the

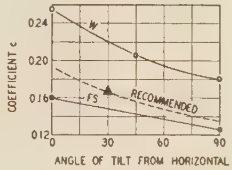

FIG. 15 COEFFICIENT OF CONVECTION c AS DETERMINED BY VARIOUS INVESTIGATORS

(Solid-triangle point calculated from tests of collectors under study.)

present collector design, runs were made with the present collectors to determine heat losses independently of their action as solar-energy absorbers, by operating after sundown. Measuring the heat input to the collector from the water rate and its temperature drop (never more than a few degrees and measured to 0.01 C) and subtracting the bottom loss, the upward heat losses of Table 4 were obtained for collectors tilted 30 deg and covered with three glass panes with 1-in. air spaces. The recorded values of q_L/A were corrected to allow for the fact that, if the entire metal plate had been maintained at water temperature instead of only the lines of contact of the water tubes with the plate, the heat loss would have been about 3 per cent greater. This correction applies in the opposite direction where the collectors are in daytime use, since the metal between parallel water tubes is then warmer than the tubes.

To evaluate c from the measured heat flux and Equation [11] or [13], values for ϵ_C, ϵ_G, and h_w must be known. The hemispherical reflectivity of glass for long-wave-length radiation (from a surface of say 140 to 300 F) is close to 4 per cent for all glasses; since glass is opaque to such radiation, the term ϵ_G is complementary to reflectivity, or 0.96. The hemispherical emissivity ϵ_C of the blackened-receiver surface is taken as 0.95, which should be in error by no more than 2 per cent for a well-blackened surface. The outside wind coefficient h_w is assumed to be 4.07 corresponding to a 10-mph wind. A considerable error in this assumption has little effect on a collector with three glass plates. Based on these values and the measured heat flux, the coefficient c in Table 4 was calculated by use of Equations [11]. Equation [13] would have given substantially the same result. The two values obtained are seen to be in excellent agreement. Their mean, 0.166, is plotted as a triangle in Fig. 15, for comparison with previous recommendations. Although the value obtained for c is to some extent dependent upon values taken for ϵ_C, ϵ_G, and h_w, the uncertainty in those values is not enough to explain the difference between the triangle c and the values given by Wilkes. The discrepancy is probably due to difference in plate-to-plate spacing or difference in lateral extent of the individual air chambers.

For collectors of the general design of those described here, it is recommended that values of c be read from the dotted curve of Fig. 15, which follows the trend with tilt of Wilkes's values but differs in absolute magnitude. Although Equation [13], with c from Fig. 15, may now be used for predicting heat losses, it is somewhat cumbersome. It has been used to calculate q_L/A over the normal range of t and t_a to be expected, for collectors tilted 30 deg and provided with one, two, or three glass plates. The results appear in Fig. 16, in the form of an over-all coefficient of heat transfer U for use in the relation

$$q_L/A = U(t - t_a) \qquad [17]$$

TABLE 5 COMPARISON OF ACTUAL AND CALCULATED PERFORMANCE OF COLLECTORS

Q_U/A = useful heat into water stream, Btu per sq ft (experimental)
Q_B/A = loss through bottom of collector (calculated)
Q_L/A = loss through top of collector (calculated)
Q_A/A = heat absorbed by collector plate (calculated) (should = $[Q_U + Q_B + Q_L]/A$)

Period April 6 to July 1, 1940[a]

Total[a]	21442	21614	21753	1315	13437	39625	36505	26188	23068

[a] Data were not taken on every sunny day during the period. Consequently the "total" is not a measure of total possible heat collection. The top table is based on 69 days data, the lower one on 44.

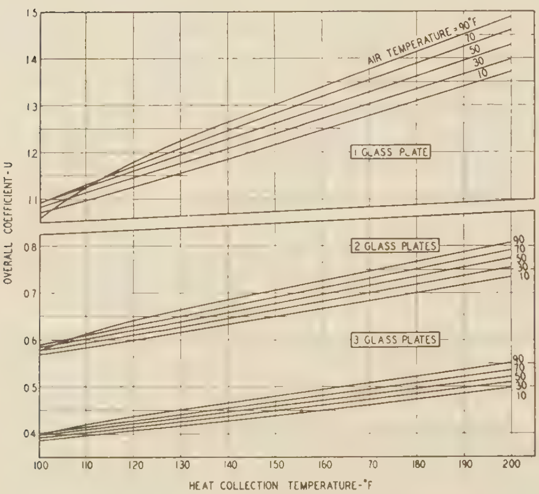

FIG. 16 OVER-ALL HEAT-TRANSFER COEFFICIENT FOR USE IN CALCULATION OF HEAT LOSSES FROM FLAT-PLATE COLLECTORS
(Tilt from horizontal = 30 deg; collector-surface emissivity = 0.95; wind coefficient = 4.07; 10 mph.)

Although this equation and Equation [13] are applicable strictly to a collector plate at a uniform temperature T, they apply with negligible error to the more important case of plate temperature varying continuously from water inlet to outlet, if T is replaced by the arithmetic-mean water temperature. This approximation would be exact if U were independent of T.

The heat loss through the bottom of the collector boxes may be calculated by conventional methods; by use of sufficient insulation it may be made as small as is consistent with the value of the heat saved. In the present installation, bottom losses were minimized to increase the accuracy of determinations of useful-heat collection. Insulation under the blackened plate consisted of an air gap, about 4 in. of glass wool and $1^1/_2$ in. of mineral wool. For such construction, the heat loss through the bottom is 0.051 Btu per deg F per sq ft per hr. This makes no allowance for insulating value of the roof boards on which the collectors rest or the small air space between the collectors and the roof. However, the value of this air space is offset by the fact that a certain amount of air may circulate through it; and a 20 per cent error in the assumed over-all coefficient introduces an almost negligible error into the calculation of useful-heat collection.

Correlation and Interpretation of Actual and Calculated Results

With all the terms on the right side of Equation [3] evaluated, the calculated and actual performance of the collectors may be compared. It is to be remembered, however, that the formulation of terms in Equation [3] neglected the effects of dirt on the outer glass panes, shading of the blackened surface by the collector walls, heat capacity of the collectors, and resistance to lateral heat flow in the absorbing surface, which has been treated as a plate at uniform temperature rather than one cooled by attached parallel tubes 6 in. apart. Consequently, the calculated values of heat collection will be high until the quantitative relations given are modified to allow for the foregoing effects.

Table 5 (bottom) shows the results for the period May 9 to July 1, 1940, during which period all three sets of collectors were in operation. Table 5 (top) includes collection back to April 6, 1940. During April, only the East and center sets of collectors were in operation. The outside glass on the East collectors was kept clean; that on the others was cleaned only by rain, wind, and snow. Each day was classified as to cleanliness of the glass on the uncleaned collectors. The figures given in Table 5 include hours for which calculation indicated the possibility of useful-heat collection (i.e., $q_A > q_L + q_B$), even though the experimental measurements indicated no net collection (occasional early morning and late afternoon hours).

TABLE 6 REDUCTION IN Q_U/A AND $(Q_U + Q_B + Q_L)/A$ DUE TO DIRT ON OUTER-COLLECTOR-GLASS SURFACE

Center and West, glass cleanliness	Reduction in Q_U/A, per cent	Reduction in $(Q_U + Q_B + Q_L)/A$, per cent
1	—0.090	—0.048
2	+0.098	+0.060
3	0.497	0.306
4	3.31	2.00
5	4.73	2.71
Weighted mean	1.03	0.62

Table 5 (bottom) indicates that the heat collection by the center unit is slightly higher than by the West unit, neither of which was ever cleaned. The difference, 0.8 per cent, is a measure of the similarity of the units in construction and dirtiness. For grade-

TABLE 7 HEAT QUANTITIES FOR THREE PERIODS USED TO OBTAIN EFFECT OF HEAT CAPACITY

Period	Measured Q_U/A		$(Q_U + Q_L + Q_B)/Q_A$		Difference, column 5—column 4
	Morning	Afternoon	Morning	Afternoon	
1	3645	4225	0.885	0.945	0.060
2	4778	5221	0.903	0.948	0.045
3	3490	4173	0.871	0.957	0.086
Average					0.064

1 cleanliness, all three units may be compared. It is seen that the standard or east unit (always clean) is about midway between the other two, which differ by less than 0.5 per cent.

The effect of dirt on useful-heat collection may be obtained by comparing the mean of the West and center units with the clean East unit. Table 6, second column, shows the effect of dirt on useful-heat collection q_U/A; the third shows the effect on absorption q_A/A, calculated by adding $(q_B + q_L)/A$ to q_U/A. The third column is more readily interpreted since it is a direct measure of the effect of dirt on the transmittance of the glass plates. (Its value is later referred to as D.) The effect of dirtiness on net collector performance, 4.7 per cent maximum and 1 per cent average, is surprisingly small, especially considering the location of the test unit in an industrial district near a power plant and 100 yd from a four-track railroad. Horizontal collectors would probably not self-clean as effectively.

The data in Table 5 may be used to study the effect of heat capacity of the collectors, an effect manifested in an abnormally low useful-heat collection during the morning hours when a portion of the absorbed heat is utilized in bringing the glass plates and the insulation below the collector plate up to equilibrium temperature. A comparison was made of those days on which complete early morning and afternoon records were available (42 days), the days being divided chronologically into three groups of 14 days each. In order to make certain that thermal equilibrium was reached during each morning period, no such period was used of less than 3-hr duration. Morning and afternoon periods were chosen to balance in total number of hours and in total calculated heat absorption Q_A/A to within 1 per cent. Table 7, columns 2 and 3, gives the measured useful-heat collection during the periods. To make the morning and afternoon values for one period comparable, the measured Q_U/A values were increased by the calculated values of heat loss, Q_L/A and Q_B/A, and then divided by

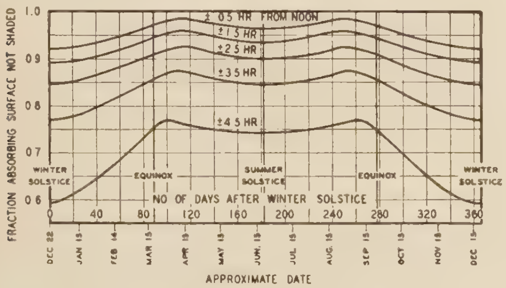

FIG. 17 SHADING EFFECT DUE TO SIDES OF SQUARE COLLECTOR HAVING DEPTH EQUAL TO 9.6 PER CENT OF SIDE DIMENSION, AS IN COLLECTORS TESTED, AND TILTED 30 DEG SOUTH AT 40 DEG NORTH LATITUDE

the respective calculated values of total absorption, Q_A/A. The results appear in columns 4 and 5, their difference in column 6. To obtain the heat lost by storage in the collectors in each period, column 6 is multiplied by the average value of Q_A/A for morning and afternoon. This loss amounts to 420, 378, and 632 Btu per sq ft for the successive 14-day periods, or to 30, 27, and 45 Btu per sq ft per day. By combining the average value 34, with the average difference 94 F between the temperature of heat collection and that of the early morning outside air, one obtains for the heat loss caused by heat capacity, a value of 0.36 Btu per sq ft per day per deg F temperature difference between collector and air. For comparison with this experimental value, the amount of heat stored in 1 sq ft of collector when at equilibrium temperature (calculated from the materials of construction and assuming linear temperature drop both ways from the plate) was divided by the temperature difference between collector and outside air. The resulting value, 0.57 Btu per deg F temperature difference per sq ft is higher than the experimental one. This was expected since the collector plate and glass and insulation surrounding it are preheated by solar radiation during the early morning period preceding the period of heat collection. For the prediction of heat-capacity losses in collectors of other design than those under discussion, it is suggested that the value corresponding to the 0.57 of the present collectors be estimated and then reduced by about one third to allow for early morning preheating. Calling this value C, the heat-capacity loss Q_H/A per sq ft per day is given by

$$Q_H/A = C(t - t_a) \qquad [18]$$

The calculation of heat capacity of the present collectors indicates that the glass plates and bottom insulation contribute 52 per cent and 28 per cent, respectively, of the total, and that the copper absorbing surface and tubes attached to it account for but 20 per cent. Although the morning loss due to heat capacity is relatively small in the present collectors, such is not the case in a number of solar hot-water heaters on the market, due to too generous use of metal, large undrained pipes, and insulation of high density.

The calculation of useful-heat collection by Equation [3], with heat loss predicted from Equation [13] (or its equivalent Fig. 16, and Equation [17]), involves the assumption that the collector plate is at a uniform temperature T, whereas, in the collectors here studied, as well as in some of the commercial units, the temperature is at an average value of T only along the lines of contact of the plate with the pipes through which fluid flows, and higher in between. It may be shown that the ratio F of useful-heat collection from the latter system to one having a uniform plate temperature is given by

$$F = \frac{2}{a}\left(\frac{e^a - 1}{e^a + 1}\right) \qquad [19]$$

where

$a = W\sqrt{U'/kM}$
$U' = U + U_D$
U = over-all loss coefficient, plate to upper air (Fig. 16)
U_D = over-all loss coefficient, plate to box bottom, through insulation
k = thermal conductivity of collector plate, Btu per deg F per ft per hr
W = minimum distance between parallel pipes, measured along collector plate, ft
M = thickness of collector plate, ft

The term F may be thought of as the efficiency of the plate-pipe combination. In the present collectors it has the high value 0.97; in some commercial units, it is considerably lower.

It is now possible to modify Equation [3] to allow for the various complicating factors discussed. The total useful heat Q_U/A collected per sq ft over a period including N days of actual operation is given by

$$Q_U/A = F\Sigma\{(q_A/A)(1 - D)(1 - S) - q_L/A - q_B/A\} - N\,Q_H/A \qquad [20]$$

where q_A/A and q_L/A are evaluated as before from Equations [2]

and [13] or [17]; D is the fractional reduction in transmittance of the glass plates due to the presence of dirt; S is a factor to allow for shading of the collector plate by the walls supporting the glass; and Q_H/A is the heat-capacity loss evaluated from Equation [18]. All these terms have been discussed except the shading factor S. The data of Table 5 (bottom) may be used to evaluate it. If data from the East (clean) unit are used, $D = 0$. The total number of test periods $N = 44$. Q_H/A for the period in question averaged 36 (versus 34 given previously). $F = 0.97$. Substituting these values in Equation [20] together with values from Table 5

$$21{,}753 = 0.97\ [39{,}625\ (1 - S) - 13{,}437 - 1315] - 44 \times 36$$
$$S = 0.021$$

This factor, while called a shading factor, is obviously forced to carry the burden of all approximations in the derivations. It will be remembered that the loss of about 3 per cent by internal absorption in the glass panes was assumed a total loss, whereas it is partially effective in supplying the heat losses from the collector plate to the outer air. The true loss by shading is consequently probably more than the value 2.1 per cent (possibly 2.1 + 3/2 = 3.6 per cent), but the treatment of the problem would be enormously complicated by an attempt to make the equations rigorous in this respect.

The expected shading effect may be estimated. Geometrical relations permit construction of the curves of Fig. 17, showing the fraction of an incident beam of direct sunlight which reaches the collector surface directly, the remainder being intercepted by the walls. For the test period in question (Table 5 [bottom] data), the properly weighted average of values read from Fig. 17 is 0.9, indicating an average interception by the white-painted walls of 10 per cent. Of this, perhaps one half finally reaches the collector by diffuse reflection, and part of the remainder is useful in supplying heat losses q_L/A from the system. The residue, perhaps 3 to 5 per cent, is in good agreement with the experimental value of 2.1 per cent, modified upward to almost 4 per cent by consideration of internal absorption in the glass.

That there is no evidence of any unaccounted-for item being necessary to produce a balance is an indication of the quality of the data taken and the adequacy of the relations given for estimating the various losses. The recommendation may therefore be made that Equation [20] be used for the calculation of performance of flat-plate collectors of any desired number of glass plates at any tilt, absorbing heat at any desired water temperature. Evaluation of the terms of Equation [20] involves use of pyrheliometric data, Equations [2], [17], [18], [19], and values for dirtiness D and shading factor S. An average value of 0.006 has been found for D. For the shading factor S a value equal to about 30 per cent of the complement of the average of values read from Fig. 17 is recommended. Equation [20] and the equations giving its components will simplify considerably when restricted in applicability to a particular collector design. In its general form given here, it is useful for disclosing unsuspected causes of poor performance in commercial solar heaters.

Space prevents a discussion of the relative importance of the various terms of Equation [20], beyond pointing out that, as the heat loss q_L/A approaches in magnitude the heat absorbed q_A/A, the useful heat collected is very sensitive to small changes in the operating variables. Application of Equation [20] to the determination of expected performance of solar-heat collectors in various localities and economic studies of the feasibility of solar house heating and absorption refrigeration will constitute the subject matter of later papers of this series.

Nomenclature

A = area, sq ft

C = loss due to heat capacity, Btu per sq ft collector per deg F, temperature difference of collector plate and air, per cycle of operation

c = constant in Equation [10]

c' = constant in Equation [14]

D = fractional reduction in transmittance of glass plate system due to surface dirt

e = natural base of logarithms

F = ratio of useful heat collection by a finned surface to that by a surface of same area maintained at uniform temperature

F_ϵ = factor to allow for emissivity of surfaces in heat-transfer relation, Equation [12]

f = effective thermal resistance of outer glass plate relative to others, Equation [13]. Numerical value = 0.36 for ten-mile wind

H_S = total solar irradiation of a horizontal surface, cal per sq cm × hr

H_D = diffuse irradiation of a horizontal surface, cal per sq cm × hr

h = convection coefficient, plate to plate, Btu per sq ft × hr × deg F, temperature difference

h_w = forced convection coefficient due to wind on top plate, Btu per sq ft × hr × deg F, temperature difference of top glass and air

K = extinction coefficient for total solar radiation through glass, in.$^{-1}$

k = thermal conductivity of collector plate, Btu per sq ft × hr × (deg F/ft)

L = thickness of glass, in.

M = thickness of collector plate, ft

N = number of days or heat collection periods in a long test period

n = number of glass plates (also used as refractive index, but not in equations)

Q = heat quantity, Btu

Q_H = loss, per collection period, due to heat capacity of collector, Btu

Q_U = useful heat collected over a period involving several cycles of heating and cooling, with allowance for dirt on glass, wall shading, heat capacity, and fin effects, Btu

q = rate of heat flow Btu per hr

q_A = rate of heat absorption by collector plate, Btu per hr

q_c = rate of heat transfer between two parallel plates by convection only, Btu per hr

q_B = rate of heat loss through bottom of collector, Btu per hr

q_L = rate of total heat loss through top of collector, Btu per hr

q_U = rate of net useful heat collection by a collector, assuming no losses due to dirt, wall shading, heat capacity, or fin effects, Btu per hr

R = ratio, direct solar radiation falling on tilted surface: same on horizontal surface

R' = ratio, diffuse solar radiation on tilted surface: same on horizontal surface

r = surface reflectivity of glass

S = factor allowing for shading of collector plate by walls

$T, (T_1, T_n, T_a)$ = absolute temperature of collector plate (first glass plate, nth plate, and outer air), deg F + 460 deg.

$t, (t_a)$ = temperature of collector plate (outer air), F

U = over-all coefficient of heat transfer for calculating upward losses from collector, Btu per sq ft × hr × deg F temperature difference of collector plate and outer air

U_D = over-all coefficient for loss through bottom of collector,

Btu per sq ft × hr × deg F temperature difference of collector plate and air below

U' = $U + U_D$

W = distance between water-cooling tubes on collector plates, ft (measured along collector plate, between nearest points)

$\alpha(\alpha')$ = absorptivity of surface of collector for direct (diffuse) solar radiation

β = tilt of collectors from horizontal toward equator, deg

∂ = declination of sun, deg; + in summer

$\epsilon_C(\epsilon_G)$ = emissivity and absorptivity of collector plate (glass plate) for low-temperature radiation

θ_T = angle between solar beam and normal to tilted surface

θ_Z = angle between solar beam and normal to horizontal surface = zenith angle of sun

$\rho_1(\rho_n)$ = over-all reflectivity of one (n) plate(s) of nonabsorbing glass

σ = Stefan-Boltzmann constant, Btu per sq ft × hr × (deg R^4)

Σ = summation

$\tau_1(\tau_n)$ = over-all transmittance of one (n) plate(s) of nonabsorbing glass

$\tau_a(\tau_r)$ = over-all transmittance of a system of glass plates, allowing for absorption but not reflection losses (reflection but not absorption losses)

$\tau(\tau')$ = over-all transmittance, for direct (diffuse) sunlight, of a system of glass plates, allowing for absorption and reflection losses

ϕ = latitude

ω = hour angle of sun from solar noon, calc as 15 deg per hr

Discussion

F. A. Brooks.[6] This work on the utilization of solar energy is most welcome in that it advances the technique of utilizing directly the earth's primary energy and is another step toward saving our natural resources.

The flat-plate absorber is inherently the most efficient thermally but is difficult to make trouble-free over a long life. Possibly the copper tubing (for forced circulation) need not be rigidly soldered to the blackened receiving surface, although this proved necessary in the Carnes design.[7] For thermosiphon circulation, avoiding the troubles of pumps and thermostats, the flat absorber virtually means a flat tank which presents serious staybolt problems if used under city water pressure. Probably the best compromise for the thermosiphon absorber will be a commercial flattened-pipe heat exchanger laid on a grooved metal pan with some nonhardening adhesive for thermal bond.

The most disappointing feature of the fixed solar absorber is its sacrifice of solar energy with inclination of the sun's rays. It would be of interest to investigate the use of twin absorbers, one faced for maximum intake of the morning sunshine and the other for the afternoon. If the two absorbers operated separately the one not effectively exposed probably would not discharge any of the heat absorbed by the other because the diffuse sky radiation would be enough to counteract reverse circulation. Such a dual system would not be the same as a larger single absorber (except at noon time) because higher temperatures would be available in the directly exposed absorber.

For house heating, it would seem advantageous to arrange for the direct entry of the morning sunshine into the living quarters, if adequate reflector shades are provided to prevent overheating. In this case a southeast wall and roof of glass is needed and the construction might well follow the new greenhouse design of the Boyce-Thompson Institute[8] in which no heating other than by illuminating lamps has been found necessary. If direct sunshine is to be used with water-heating absorber pipes under the same roof glass, these pipes should not have wide fins, but the reflector shade might be designed so to surround the pipes that, when closed, all the glass area of sunshine would be utilized by reflection onto the pipes.

The writer's personal acquaintance with the project described is limited to the construction period and initial operation. Therefore, the only direct comments he might offer are that the need for absorber units of low heat capacity to respond quickly in partly cloudy weather is very different in Boston, an unfavorable location for solar heaters, than in the Southwest where one expects to find their most extensive use; and that the installed cost of the storage tank and its insulation is excessive.

Authors' Closure

Professor Brooks suggests that low heat capacity is a less necessary characteristic of solar absorbers in the Southwest than in Boston where the weather is more variable. Our discussion of "heat-capacity loss" by solar absorbers was perhaps misleading in failing to point out that, even in the variable sunshine of Boston, the operation of a solar-heat collector is generally continuous throughout the day, i.e., if the sun is bright enough to bring the collector up to operating temperature and start the circulating pump, diffuse radiation during subsequent cloudy periods is usually sufficient to prevent the collector temperature from dropping, although the useful transfer rate to the water may of course drop to almost nothing during the passage of a cloud.

The data of Table 5 of the paper indicate a heat collection of about 500 Btu per sq ft per day of operation, or about 400 Btu per sq ft per day, including all days in the period, without regard to operation. (Actual heat collection is slightly greater than indicated by Table 5; for various reasons certain heat collection on Sundays and early morning hours was not included in Table 5.) Storage-tank temperature averaged 153 F for the 3-month period of Table 5, 160 F for the shorter one.

Comparing the heat-capacity loss, 34 Btu per sq ft per day, with the average daily heat collection of about 500 Btu per sq ft per day, we see that heat-capacity loss is less than 7 per cent of the average daily heat collection, when collection occurs at a somewhat higher temperature than that characterizing domestic solar water heaters. Some commercial heaters would probably have 2 to 3 times as high a loss due to heat capacity. The magnitude of the loss per square foot of collector should be the same in California as in Boston; expressed as a fraction of the total heat collected it should, of course, be less in California. The authors believe it probable that many of the California solar heaters have a heat-capacity loss equal to at least 15 per cent of the useful collection.

With respect to Professor Brooks's comments that the installed cost of the storage tank and its insulation is excessive at Cambridge, we believe the paper clearly states that the storage system was not chosen with regard to cost but with the objective of permitting other experimental work than that related to solar house heating. If he refers to storage tanks in general, rather than the one at Cambridge, we can neither agree nor disagree; economic studies are now in process.

A Method for Determining Unsteady-State Heat Transfer by Means of an Electrical Analogy

By VICTOR PASCHKIS[1] and H. D. BAKER,[2] NEW YORK, N. Y.

The known methods for solving unsteady-state or transient-heat-flow problems in solids are reviewed. The method of solution by means of an electric model is explained. A proof experiment is described. Finally, a permanent model, constructed at Columbia University, is described.

I—Introduction

THIS paper is a continuation of work carried out by the first author, in Europe, on a method first devised by C. L. Beuken (1, 2).[3]

When a solid mass is changing temperature as a result of heat exchange between it and the surroundings, there are variable temperature gradients in the mass, a series of isothermal surfaces, a nonuniform changing temperature field within it, related to the time rate of heat gained or lost by the mass, and a time to attain a steady state. This is known as the unsteady state of heat transfer and may be associated with transfer through the mass into one face and out from another.

Mathematical calculations of the effect of any imposed conditions on a given mass defined by shape, size, and physical properties of its materials have depended on the solution of Fourier's differential equations for this set of conditions. Those cases that can thus be solved with acceptable simplicity are relatively few in number and exclude most of those of industrial importance (3, 4, 5).

The difficulties imposed by the mathematical approach are partially overcome by the graphical method (6). This is based on the replacing of the differential equation by an equation of finite differences, a process sometimes called step integration. The method is, however, tedious and of likewise limited application.

Experimental solution of industrial problems of unsteady-state heat transfer, depending on inserted thermocouples or other thermometric devices and on some means of measuring rate of heat transfer, is difficult, expensive, and often impossible under service conditions.

The method presented here is based on an electrical analogy. Electrical models for the solution of heat problems have long been known (7, 8, 9). Such models have been based on a geometrical similarity between the body subjected to heat flow and the model body. A fundamentally different method is applied here; the model has no geometrical similarity to the body being investigated. Instead it is based on identity in form of the fundamental equations. In this type of model a single electrical installation is susceptible of immediate adaptation to a wide range of heat-transfer problems. The solutions are then rapidly obtained by direct manipulation of instruments.

The permanent model described in section V of this paper is designed primarily for solving problems of unsteady-state heat conduction in solids with definite radiation and convection boundary resistances. Regarding the latter, it is necessary here to assume a definite average value for the ambient temperature. A model adapted to deal fully with problems of radiation exchange between bodies of intricate shape and nonuniform temperatures requires a different design. Such a model has been built by one of the authors (10). Similarly, to deal only with complex steady-state conduction problems, a different design would be better suited.

In what follows, the method will be explained in theory and in practical application to unsteady-state problems. The results of an experiment performed to verify its soundness will be presented, the scope of the heat-transfer situations to which it is adaptable will be discussed, and the permanent electrical installation will be described.

II—Theory of the Method

The method rests on the fundamental similarity between the flow of heat within a rigid body and that of charge in a noninductive electric circuit. Conservation of the scalar quantity, charge, corresponds to conservation of heat. The scalar point function, electric potential, corresponds to the scalar point function, temperature. Ohm's law corresponds to Fourier's law. The concept "electric capacity of a conductor," corresponds to the concept "thermal capacity of a portion of mass."

The method is based directly on the identity in form between the defining equations for thermal and electric resistance, and those for thermal and electric capacity. Thus

$$R_e = \frac{\Delta V}{I} \qquad [1]$$

and

$$R_t = \frac{\Delta t}{q} \qquad [2]$$

where

R_e = electric resistance
R_t = thermal resistance
I = electric current through R_e
q = hourly heat flow through R_t
ΔV = difference in electric potential across R_e
Δt = difference in temperature across R_t

Similarly

$$C_e = \frac{Q_e}{\Delta V} \qquad [3]$$

and

$$C_t = \frac{Q_t}{\Delta t} \qquad [4]$$

[3] Numbers in parentheses refer to Bibliography at end of paper.

Contributed by the Heat Transfer Division and presented at the National Meeting of the Applied Mechanics Division, Philadelphia, Pa., June 20–21, 1941, of The American Society of Mechanical Engineers.

where

C_e = electric capacity
C_t = thermal capacity
Q_e = charge stored in C_e
Q_t = heat stored in C_t
ΔV = rise in electric potential of C_e due to Q_e
Δt = rise in temperature of C_t due to Q_t.

Fundamentally, no other quantities than R_t, C_t, t, Q_t, q, and τ_t are involved in the derivation of the general Fourier heat-conduction equation

$$\frac{\partial t}{\partial \tau_t} = a\left(\frac{\partial^2 t}{\partial x_t^2} + \frac{\partial^2 t}{\partial y_t^2} + \frac{\partial^2 t}{\partial z_t^2}\right) \qquad [5]$$

where

τ_t = time in the thermal circuit
$a = \dfrac{k}{c\rho}$ = thermal diffusivity
c = heat capacity per unit mass
k = thermal conductivity
ρ = density
t = temperature at point (x_t, y_t, z_t) at time τ_t.

The distribution of resistance and capacity in space, assumed in the Fourier equation to be uniform and continuous, is represented by the space coordinates x_t, y_t, z_t.

It follows from this identity in form of the fundamental defining equations that all mathematical developments based upon them, respectively, will likewise be identical in form. Thus, take the case of one-dimensional flow. In heat transfer this amounts to conduction across an infinite slab or along a rod insulated at the sides. There Fourier's equation reduces to

$$\frac{\partial t}{\partial \tau_t} = a\,\frac{\partial^2 t}{\partial x_t^2} \qquad [6]$$

where

x_t = distance along the heat flow path
t = temperature at distance x_t at time τ_t.

In electricity the corresponding case is that of flow along an ideal "R_eC_e-cable." This is a linear conductor insulated at the sides and with resistance and capacity uniformly distributed along its length, but of negligible inductance. It is to be noted that there is no thermal analogue to inductance; hence, an electric circuit to be analogous must be noninductive. Here the well-known equation applying to transient phenomena is

$$\frac{\partial V}{\partial \tau_e} = \frac{1}{R_eC_e}\,\frac{\partial^2 V}{\partial x_e^2} \qquad [7]$$

where

τ_e = time in the electric circuit
R_e = distributed resistance per unit length of cable
C_e = distributed capacity per unit length of cable
x_e = distance measured along the cable
V = electric potential at distance x_e and time τ_e.

Clearly [6] and [7] are identical in form; V replaces t, and $\dfrac{1}{R_eC_e}$ replaces a.

Then to represent a one-dimensional heat-conduction problem by an electric circuit, the following procedure applies. Express the various quantities R_t, C_t, q, t, and x_e and τ_t for the thermal circuit in any desired consistent system of units. Choose a consistent system of units (not necessarily the same) for R_e, C_e, I, V, x_e, and τ_e in the analogous electrical circuit. Then make $x_e = x_t$ and divide the thermal circuit into elements of Δx_t length, and the corresponding R_eC_e cable into an equal number of elements of length Δx_e. Give every element Δx_e the same number of units of electric resistance R_e and electric capacitance C_e, as the corresponding element Δx_t has units of thermal resistance R_t and thermal capacitance C_t. It is not necessary that the thermal path be of uniform cross section or that the elements Δx_t be equal. Then by Equations [1], [2], [3], and [4], or [6] and [7] all readings for V and I taken in the cable at points defined by x_e and τ_e will be numerically equal to the values of t and q in the thermal circuit at points defined by x_t and τ_t, for $x = x_t$ and $\tau_e = \tau_t$.

III—Practical Application of the Method

Since R_e and C_e occur in Equation [7] only as the product $R_e\,C_e$, the result will not be affected by changing R_e and C_e individually, provided their product is not changed. Thus C_e may be reduced to $\dfrac{C_e}{m}$ if R_e is correspondingly increased to mR_e. Moreover, m may have any convenient value. Also, since Equation [7] is homogeneous in V, V may be replaced by $l\,V$ without affecting anything else. It is evident from the dimensions in Equation [7] that, if R_eC_e is replaced by nR_eC_e, or $n(mR_e)\,\dfrac{C_e}{m}$ and τ_e is replaced by $n\tau_e$, the form of the solution will not be altered.

Equation [1] implies that if ΔV is thus replaced by $l\Delta V$ and R_e is replaced by nmR_e, I will be replaced by $\dfrac{lI}{nm}$. Similarly, Equation [3] implies that if ΔV is thus replaced by $l\Delta V$ and C_e is replaced by $\dfrac{C_e}{m}$, Q_e will be replaced by $\dfrac{l}{m}\,Q_e$.

By suitable choice of the scale factors, m, n, and l, the electric model may be operated at convenient voltages and transient time intervals and built with feasible magnitudes of resistance and capacitance. The possibility of changing the time scale is of paramount importance for the practicability of the method. A heat process actually taking hours or days may be condensed to a few minutes in the experiments. On the other hand, a short process requiring only fractions of a second may be stretched in the model so as to last several minutes; thus times are achieved which allow easy reading of instruments.

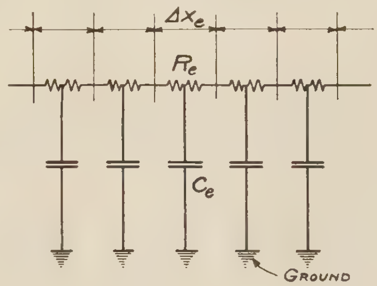

Fig. 1

In practice the R_eC_e-cable is replaced by a "lumped" cable. This amounts to replacing the resistances and capacitances of elements Δx_e by resistors in series and corresponding condensers in parallel, as indicated in Fig. 1. The smaller the "lumps," Δx_e, the more perfect will be the representation of the actual cable by the lumped cable. A feasible compromise is usually possible in practice.

This "lumping" procedure is a standard technique in electrical engineering, used when it is desired to represent an actual cable by a laboratory model (11). The number of sections required depends on the desired accuracy and the dimensions and properties of the body to be investigated. In this respect the model

method does not differ from the graphical method (6). Both are based essentially on the idea of replacing a differential equation by an equation of finite differences.

In a somewhat similar manner any three-dimensional heat-conduction problem may be represented by an electrical model. In this, the general case, the thermal capacity C_t of each volume element $\Delta x_t\ \Delta y_t\ \Delta z_t$ is replaced by a condenser and the three orthogonal components of thermal resistance are replaced by three electric resistors, as indicated in Fig. 2.

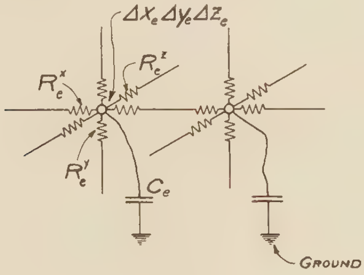

FIG. 2

Radiation and convection surface boundary resistances may be represented by electric resistors R_e without any corresponding condensers.

When the surface temperature differs by a large amount from the ambient temperature, the surface boundary resistance may be a fairly rapid function of temperature. This requires that the corresponding electrical resistor repeatedly be adjusted in magnitude during the period of an experiment. A similar degree of adjustment is required more generally, owing to variations in k and c with changing temperature.

A practical difficulty in applying this method to three-dimensional problems lies in the vastly increased number of resistors required. This implies, in addition to the added expense for equipment, an important increase in manipulation difficulties. The latter is particularly serious in the case of changing thermal resistance when this large number of resistors must repeatedly be adjusted in magnitude during the course of an experiment.

IV—Preliminary Experiment

In order to verify the theory and to determine the practicability of the method, a trial experiment was performed in the laboratory at Columbia University. A problem was selected for which actual thermal test data were available. The apparatus was built from such equipment as happened to be obtainable in the Columbia laboratories at the time. The problem may be stated thus:

A steam pipe line, $1^1/_4$ in. nominal diameter, is covered with cork insulation of 1.4 in. thickness. The inside of the pipe is suddenly raised in temperature from 88 F to 211 F by admitting steam. What will be the temperature distribution in the insulation as a function of time for a given time cycle of turning on and off the steam? What will be the heat loss compared to that for a continuously hot pipe?

Actual measurements of the temperature-time functions were made for this case by Perry and Berggren at the University of California. Thermocouples were inserted at various depths in the insulation. Steam was suddenly admitted and the several temperature rises were noted. The results are shown plotted in Fig. 5. It was found, however, that owing to the thermal capacity of the steel pipe, the temperature rise at the inner surface of the cork was subject to some lag. This lag is shown in Fig. 3. The heat loss was not measured.

The physical properties of the cork insulation must be known to solve this problem by means of the electric model. These are given by Perry and Berggren as follows:

Thermal conductivity k = 0.025 Btu per ft per F per hr

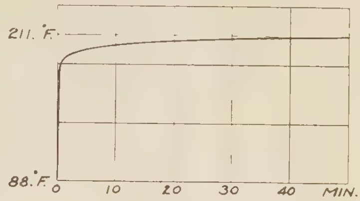

FIG. 3

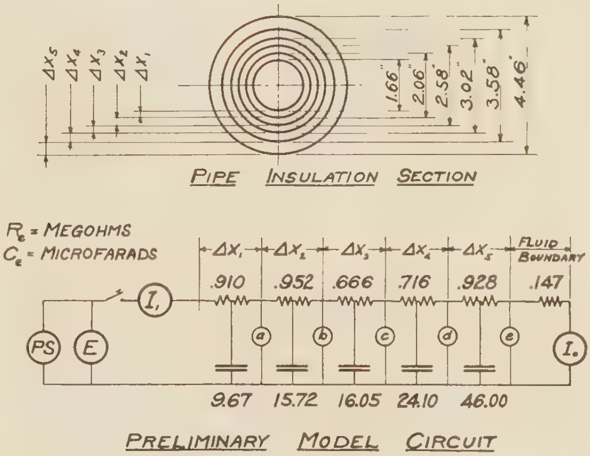

FIG. 4

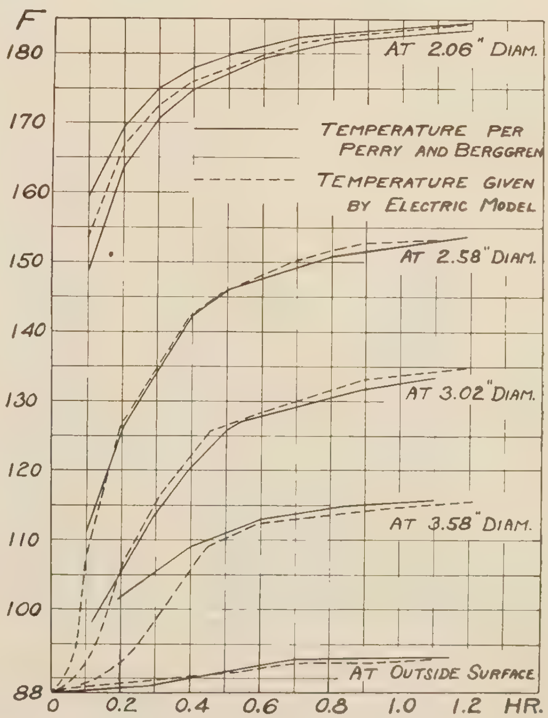

FIG. 5

Specific heat c = 0.485 Btu per lb per F
Density ρ = 8.15 lb per cu ft
Thermal diffusivity a = 0.00633 ft² per hr

The fluid boundary conductance on the outer surface may be deduced from the steady-state conditions as observed by Perry and Berggren. Here, the hourly heat flow through the insulation must equal the heat flow from the outside surface to the surroundings. The former may be computed from the radii, physical properties, and the temperature drop in the insulation. Perry and Berggren give the latter as 118.8 F for steady state. Assuming the ambient temperature to be 88 F implies 4.2 F drop from the outer surface to the surroundings. From these data the surface boundary conductance U is computed to be $3.85 \dfrac{\text{Btu}}{\text{ft}^2 \text{ F hr}}$. However, U will vary as the outer surface temperature varies.

In setting up the electric model the standard electric units were chosen. Thus R_e is in ohms, C_e is in farads, Q_e is in coulombs, V is in volts, I is in amperes, and τ_e is in seconds.

The usual thermal units are retained. Thus R_t is in F hr per Btu; C_t is in Btu per F; Q_t is in Btu; t is in F; q is in Btu per hr; and τ_t is in hours.

Preliminary trials suggested the following values for the scale factors:

l = 2 means: 2 volts in the electric circuit correspond to 1 F in the thermal circuit

n = 200 means: 200 sec in the electrical circuit correspond to one hour in the thermal circuit

$m = 0.329 \times 10^4$.

Then the numerical value of the thermal resistance in hr F/Btu for any element Δx_t in the thermal circuit must be multiplied by $nm = 0.658 \times 10^6$ to obtain the number of ohms to use for the corresponding resistor in the electric model. Similarly, the numerical value of the thermal capacity in Btu per F for any element Δx_t in the thermal circuit must be multiplied by $\dfrac{1}{m} = \dfrac{1}{0.329} \times 10^{-4}$ to obtain the number of farads to use for the corresponding condenser in the electric model.

Then by Equation [1] multiplying ΔV by factor $l = 2$ and multiplying R_e by factor $nm = 0.658 \times 10^6$ results in multiplying I by factor $\dfrac{l}{nm} = 3.04 \times 10^{-6}$. Thus 3.04 microamperes in the electric model will represent an hourly heat of 1 Btu per hr in the thermal circuit.

Similarly, by Equation [3], multiplying ΔV by factor $l = 2$ and multiplying C_e by factor $\dfrac{1}{m} = \dfrac{1}{0.329} \times 10^{-4}$ results in multiplying Q_e by factor $\dfrac{l}{m} = 6.08 \times 10^{-4}$. Thus 6.08×10^{-4} coulombs in the electric model will represent 1 Btu in the thermal circuit.

In order to effect the actual set-up of the electric model, the insulation on the steam pipe was divided into five layers or tubes, so chosen as to conform to the positions of the thermocouples in Perry and Berggren's work. The thermal capacity of each of these tubes was computed in Btu per F from the dimensions and the physical constants. Similarly, the thermal resistance of each tube for radial heat flow was computed in F hr/Btu. Then the number of farads and ohms to use in corresponding condensers and resistors in the electric model were obtained by multiplying these by $\dfrac{1}{0.329} \times 10^{-4}$ and 0.658×10^6, respectively.

The fluid boundary resistance was represented by a single resistor. Variations with temperature are neglected as being small in comparison with other resistances in series.

TABLE 1

Time "on" / (Time "on" + time "off")	Cycles per 24 hr: "On" time = 1/2 hr	Cycles per 24 hr: "On" time = 1 hr	Loss in Btu per lineal ft of pipe per cycle: "On" time = 1/2 hr	Loss in Btu per lineal ft of pipe per cycle: "On" time = 1 hr	Loss in Btu per lineal ft of pipe per 24-hour period: "On" time = 1/2 hr	Loss in Btu per lineal ft of pipe per 24-hour period: "On" time = 1 hr
0.2	9.6	4.8	18.4	29.8	176.7	143.0

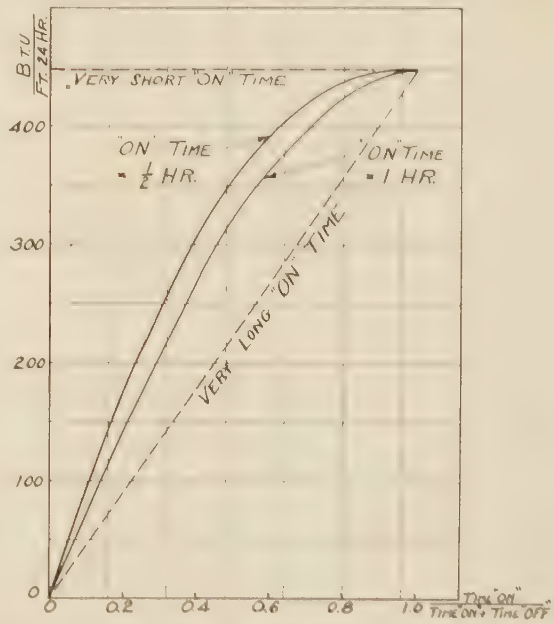

FIG. 6 HEAT LOSS FROM STEAM PIPE UNDER INTERMITTENT LOADING

The subdivision of the insulation and the corresponding circuit used in the electric model are shown in Fig. 4.

In taking data on the model it was found to be feasible to regulate E manually to simulate the actual temperature rise on the inner surface shown in Fig. 3. The readings in volts on the voltmeter E and on the electrostatic voltmeters a to d, Fig. 4, must be divided by two to give degrees Fahrenheit. Similarly, the readings in seconds on the stop-watch must be divided by 200 to give hours. After being thus converted back to thermal units, the results are plotted in Fig. 5. The curves representing the actual measurements made by Perry and Berggren are plotted superposed, upon those obtained with the electric model.

It is evident from Fig. 5 that the two sets of curves nearly coincide. Discrepancies may be attributed in part at least to two causes not inherent in the method. First, the difficult character of the measurements made by Perry and Berggren indicates that their data may be subject to appreciable error. Second, it was noted in the foregoing that the preliminary model was made of apparatus of varying quality such as happened to be available about the laboratory. Also, variations of resistances with temperature have been neglected.

The close check obtained in this trial experiment may be regarded as substantial evidence for the soundness of the principles on which this method is based. The experiment proves that the manipulation of the electric apparatus is practicable for problems of at least this degree of difficulty.

The electric model was also used to measure the heat loss from the steam pipe, not only in steady state, but also for periodic applications of steam. This is a practical problem. Perry and Berggren did not attempt to do this.

The procedure was as follows: Voltage was applied to *PS*, Fig. 4, for the "steam on" periods. The voltage was "switched off" at *PS* for the "steam off" periods. The current was read at I_0, Fig. 4, at intervals of 10 sec. This was continued until the current-time curves for successive cycles were identical. The values of the current in microamperes were then divided by 3.04 to give the heat flow from the outer surface to the surroundings in Btu per hr. Readings on the stop-watch in seconds were divided by 200 to give the time in hours. From the periodic plots of heat flow against time the total heat loss in Btu over a 24-hour period was computed. The results for various types of cycle are given in Table 1 and Fig. 6.

V—Permanent Apparatus

A permanent electric model, as indicated in Fig. 7, has been erected at Columbia University. This model differs from the original model of Beuken (1) by many modifications and improvements. The most important of these are arrangements for changing the capacity during the experiments and for automatically recording the voltages. The whole electrical and mechanical design has been changed. Nothing is retained but the basic idea.

This model contains 525 condensers, divided into 15 equal groups. One group is intended for each section of the model, representing C_i for Δx_i or $\Delta x_i\ \Delta y_i\ \Delta z_i$ in the one- and three-dimensional flow, respectively. The condensers range in size from 0.1 μf to 20 μf, in such a manner as to make the capacity of any section available in steps of 0.1 μf. The total capacity is 2280 μf or 152 μf per section. A number of reserve condensers bring the total available capacity to more than 2400 μf. All condensers are accurate to within plus or minus one per cent. Owing to the high resistance of the circuits ordinarily used in the model, high insulation resistance in the condenser is of paramount importance. All condensers have at least 15,000 megohms per microfarad insulation resistance.

The condensers in each section are assembled on six trays. Each tray has a plug board to which one terminal of each condenser is connected. The other terminal is grounded. Each tray is a self-contained unit, which can be withdrawn from the frame for cleaning and inspection. Each section has its own switchboard, resistor board, and bus plugboard.

The condensers may be combined into six groups by means of flexible plug leads connecting the plugboards on the trays to the bus board. If necessary, condensers of one section can be connected to the bus board of another section. Each bus board contains six buses with a number of jacks (outlets). The six busses lead to six single-pole double-throw knife switches. In one position these knife switches connect to jacks on the resistor board. In the other position they ground the busses, and therewith the condensers connected to these busses.

The resistor boards contain four decade resistors each, which together yield any resistance value from 100 ohms to 1,111,000 ohms in steps of 100 ohms. The resistor boards can be connected by plugs and flexible leads to the busses coming from the condensers.

Ten busses run along the top of the installation of resistor and condenser sections. Their purpose is to make possible plugging in any of the instruments on any one of the sections. Furthermore, condensers and resistors can be interchanged in the different parts of the model.

A central instrument panel contains the power controls and all of the instruments.

Power supply is provided through a "regulated power" unit. When plugged in on an ordinary 110-volt alternating-current

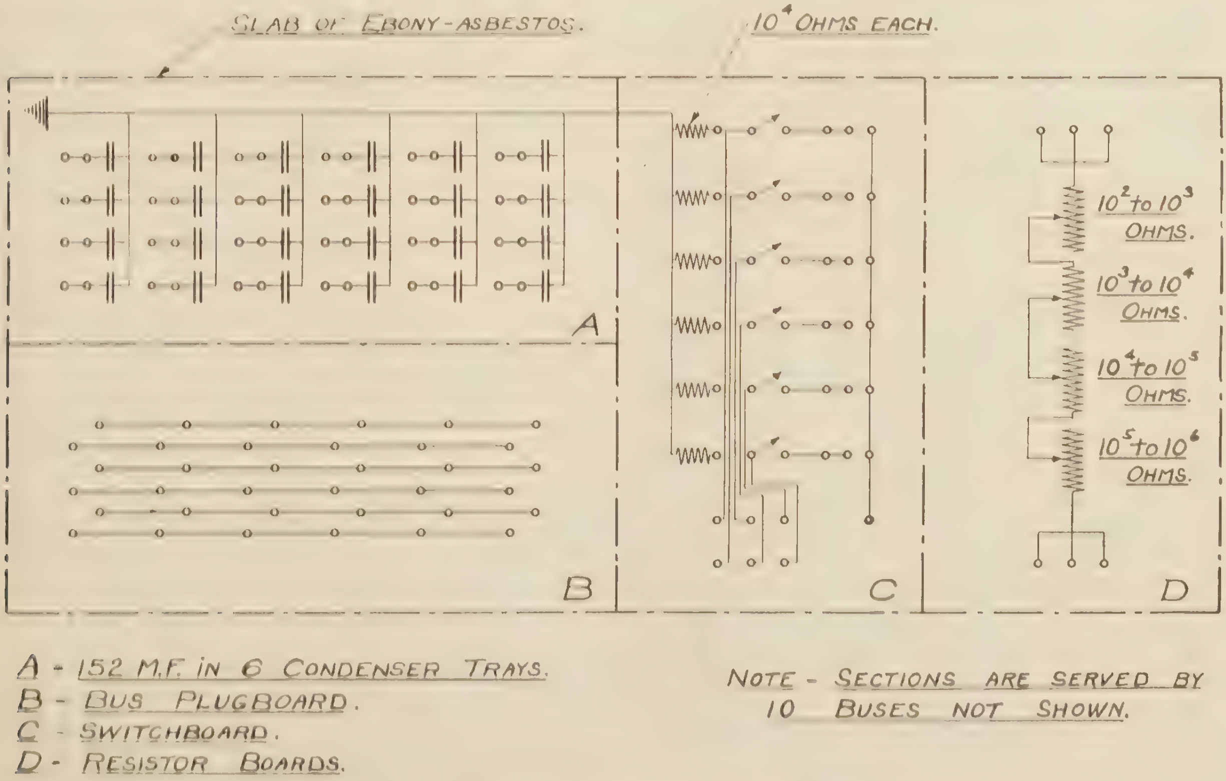

Fig. 7 Wiring Diagram of One Section of Electric Model (15 Sections Available)

outlet, this unit furnishes a practically constant direct-current output, the voltage of which can be set at any value between 130 volts and 286 volts. A voltage divider (bleeder resistor) is provided to extend the range of voltage from 130 volts down to zero. It is possible to vary the voltage to correspond to changing temperatures in the thermal circuit.

A current regulator (constant-current device) is also provided. By means of electron tubes any current value between 0.1 ma and 30 ma can be set and maintained constant throughout an experiment, regardless of apparent changes in resistance resulting from the loading of the condensers.

Since the total current dealt with is small, the voltmeters must not draw more than an exceedingly small current. On the other hand, recording instruments are desirable in order to cut down

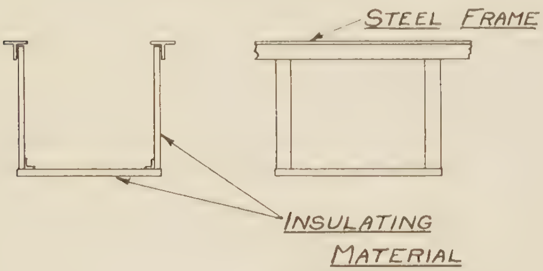

FIG. 8 INSULATING SUPPORTS

necessary assistance. Electrostatic voltmeters, which would satisfy the first condition, are ruled out by the second.

To satisfy both conditions, four two-stage amplifiers have been devised, which operate on two double-point recording millivoltmeters. Each millivoltmeter measures the voltage drop across a 100-ohm resistor and is calibrated in milliamperes. The current drawn from the model circuit by the amplifier is less than 10^{-9} amperes. This current may be neglected as compared with the leakage currents through the insulation in other parts of the model. Input voltage and current are measured by standard instruments.

In nearly every experiment need arises to determine total heat input. In the model this is represented by total charge in coulombs. To measure the total charge an ampere-hour meter is required. Because of the very small current values involved (0.03 amp and smaller) and the very short time intervals (only a few minutes) no standard instrument could be used directly. Hence an amplifier is provided. Because voltage amplification is easier than current amplification the current to be measured is passed through a resistance and the voltage drop is amplified. The amplifier used is that described by Treviño and Offner (12). A volt-minute meter then accumulates a reading which is readily converted into total charge in coulombs.

The accuracy of the electric model method depends largely on the insulation resistance of the condensers and boards against the common ground. The resistors in the model are, generally speaking, connected in series. Hence the total resistance of the model is high, possibly more than 15 megohms. On the other hand the leakage paths are in parallel. Hence the total leakage resistance becomes only a fraction of the resistance of one leak.

Condenser leakage is kept at a minimum by use of condensers with insulation resistance of at least 15,000 megohms per microfarad. The leakage of the boards was reduced by permitting no board to be fastened directly to the steel frame. All boards are fastened by means of insulating slabs as shown in Fig. 8.

ACKNOWLEDGMENTS

The authors wish to express their gratitude to Dr. T. H. Chilton of E. I. du Pont de Nemours & Co., Wilmington, Del., and Prof. T. B. Drew of Columbia University, for making available the tests of Perry and Berggren; to Dean J. W. Barker, Prof. C. E. Lucke, and Prof. Geo. B. Karelitz of Columbia University, for their support of this project; to Dean J. W. Barker for the idea of the electronic voltmeter; to Dr. E. J. Williams, Leeds & Northrup Co.; and H. L. Anderson physicist, Columbia University, for the design of the amplifier for the voltmeter; to Prof. C. J. Russell for the design of the constant-current device and for frequent advice; to Prof. J. H. Dunning for assistance with the ampere-minute meter; and to Prof. W. A. Curry and Dr. M. Avrami for advice and analysis.

Discussion

J. A. DOYLE.[4] The interesting technique described by this paper holds promise of practical usefulness by meeting a need in industrial-heating practice involved in production of metal, ceramic, and chemical products.

In this field, the viewpoint of the engineer, relative to the rate at which heat *can* be transferred should be subordinate to that of the metallurgist, ceramist, or chemist in determining the rate at which heat *should* be transferred in heating and cooling a given product made from a given material.

Time and rate of heat transfer are equally as important as temperature in such practice because of the influence of both on the structure and uniformity of the ultimate product.

Each of these essential product requirements is of interest to the engineer. Too frequently he is embarassed by failure actually due to disregard of the important time and rate factors but attributed to some other cause.

Typical examples include the striking and repeated failure of large reduction gears on merchant ships during the previous world war; unfavorable effect of variations due to mass methods

[4] Vice-President, W. S. Rockwell Company, 50 Church Street, New York, N. Y.

of heating and cooling in annealing steel and malleable-iron castings; brass, copper, and steel products; forgings, etc. Age-old variations in structural-clay products are matters of common knowledge.

The importance of mass phenomena, in heating and cooling, is not generally sensed in commercial practice. This is indicated by the fact that a piece of carbon steel $^1/_2$ in. diam, after quenching, may have a surface hardness of 600 Brinell; but a piece of the same steel 6 in. diam, subjected to the same treatment, may have a surface hardness of but 250 Brinell. The hardness tends to decrease as the mass increases, unless the rate factor varies accordingly.

Mechanical-property values in the handbooks may be misleading, if they are based on tests of smaller sections, but give no indication of allowance for variation incident to the mass effect in heat-treatment.

The cooling phase of the problem is frequently more critical than the heating phase, particularly with irregularly shaped products, because of the inverse relation of time and rate factors in comparison to the heating phase.

This relation may be in the ratio of hours and minutes, or even seconds. It is illustrated by the difference in time and rate of cooling metal products of equivalent mass, shape, and weight in annealing, normalizing, strain-relieving, tempering, and hardening by quenching. Similar relations exist in drying, burning, and cooling ceramic and chemical products.

The problem of heat transfer that confronts the metallurgist, concerned with various products of different physical characteristics, is much more complex than the problem as it usually confronts the engineer.

It is comparatively simple with relatively static conditions affecting heat transfer through insulation, refractories, metals, and other materials; or with equipment such as boilers, furnaces, prime movers, and transmission or other operating mechanisms.

Yet, the metallurgist has relatively few basic heat-transfer data as a foundation for his effort to determine the time and rate at which his products should be heated and cooled, even though he may understand the effect of heating and cooling on the material from which the product is made. That he should have such data is apparent to the engineer concerned with selection and use of metal products.

A fundamental defect in industrial-heating practice is the time-worn error of basing heat-treating shop specifications on a given material, without reference to physical structure and uniformity of products made from that material in the process of heating and cooling.

Essential factors, such as the method of heat transfer to and from the surface of the product, the method of loading the furnace, and the time, rate, and uniformity of such transfer, in heating and cooling, are usually left to the judgment of the furnace operator.

Naturally, the products frequently vary with the operatives in the same plant or in different plants producing similar products, even though the pyrometer records may be uniform. The several industries are loath to admit this because of shortsighted commercial policy, and the inertia that resists change until economic pressure forces improvement.

It has always been so and will so continue, unless and until the principles of heat transfer are better understood and effectively applied in shop practice.

Shop specifications should indicate a preferred method of controlling the operation of heating and cooling to guide the furnace operatives in producing products as uniform as the pyrometer chart indicates them to be.

Many improvements in heating practice have been effected in recent years that will decrease the great waste of metal products in the last war, but there is still much need for improvement. It will be effected in proportion as the engineer insists on higher standards of quality and uniformity in the product itself.

As reference to these vital factors is conspicuous by its absence in the literature of the several arts, and rarely referred to in production specifications, the method described by the paper may be of value in determining basic physical factors of heat transfer which, in turn, may serve as a basis for better specifications of the product itself.

The problem of uniformity is of acute interest at the moment because of the defense program. It is a fact that our armed forces have never been provided with ordnance matériel of desired uniformity. It is a physical impossibility to produce uniform products with the mass methods of heating and cooling which have been in vogue for generations. They represent more in the form of industrial folklore than rational technical development. Much of it is still in practice and condoned today by technical experts on the false assumption that a uniform pyrometer chart is proof of a uniform product.

For this reason, the procedure described by the paper is likely to be appreciated by those concerned with the use of heat-treated metallurgical, ceramic, and chemical products if, as, and when its merit is understood and publicized.

The authors, Columbia University, and this Society have rendered a constructive service in this presentation outlining accomplishment to date.

M. H. Mawhinney.[5] Without attempting to discuss the details of the method of heat-transfer determination described, it would appear to simplify greatly at least part of the unsatisfactory approach by mathematical calculation to the solution of problems in heat transfer. Tedious calculation is eliminated, but the necessity for the assumption of varying physical constants remains, which is the other weakness of the mathematical method. Assumptions of such constants by cut-and-try methods are possible, however, where a high-speed method is available for using them, and the way is paved for developments which are now retarded if not prevented by the necessity for so much effort.

The writer is primarily interested in the practical application of the method to the problems of industrial-heating-furnace design, and offers the mild criticism that the discussion of "the scope of the heat-transfer situations to which it (the method) is adaptable," which is promised in Part I fails to materialize in the remainder of the paper. Perhaps this can be remedied in the authors' closure.

The possible applications to which the method would seem to be adaptable are heat transfer through furnace linings, retorts and muffles of alloy and refractory, radiant-heating tubes, and gas-burner steels and cooling wells. The most important of these is the heat absorption of furnace linings, because the knowledge of this value and its variation with time from lighting the furnace is essential to calculations of fuel consumptions. "Steady-state" conditions are seldom reached, and, therefore, "unsteady-state" conditions are most commonly encountered. Such information is also of importance in evaluating the modern light refractory linings now used in industrial furnaces to reduce heat absorption.

A complication of this problem is the fact that furnace walls are almost always a combination of refractory and insulation. The writer would, therefore, appreciate a statement concerning the complications which this introduces into the electrical method described.

An article by the writer discussed this subject in some detail, and described the results of experimental determination in the

[5] Consulting Engineer, Salem, Ohio. Mem. A.S.M.E.

case of a furnace wall made up of $13^1/_2$ in. of firebrick and $2^1/_2$ in. of silocel insulation.[6] The inside of the furnace was held at 1700 F, and temperatures at various depths in the wall were determined by thermocouples for a period of 10 hr. Since at least 30 hr are required to approach a steady state, the variations in the first 10 hr are in the unsteady state for which the electrical method was devised.

Such a test is of strictly practical value, since it includes not only a combination of refractories in the wall, but also the effects of joints between bricks and other variables. A check of such tests, reported for industrial furnace walls by this electrical method, would be of great interest to furnace engineers.

In conclusion, the writer urges the application of this method by the authors of this interesting paper to further determination of heat flow in furnace walls of different thicknesses of firebrick and light brick, each with various thicknesses of insulation.

Authors' Closure

Mr. Doyle's statements are more timely today than when first given. The present war situation makes every waste detrimental to national interest; and waste must result, if heat-treatment and forging are carried out without due consideration of the problem of temperature uniformity in the individual piece. Referring to a previous paper[7] by Mr. Doyle on the relation of uniform pyrometer records to uniform products, the relation illustrated in his paper, which is given qualitatively, may in many instances be determined quantitatively by the authors' method.

Mr. Mawhinney's remarks may be summed up in four points, which will be answered separately:

1 The necessity of assuming the physical constants for evaluating a problem is not eliminated.

This is true. However (as Mr. Mawhinney himself indicates) the method offers the possibility of running a test on a certain problem with various physical constants. Thus the relative influence of the different constants on the result can be ascertained. This procedure is considered to be of considerable importance, because of the ease with which it shows the influence.

2 The scope of the heat-transfer situations to which the method is applicable is not outlined in the paper.

A complete list of applications would be too long, and probably incomplete, as well. The following applications, however, suggest themselves. In each of these applications, the model method can yield answers to the following questions:

a What is the temperature change and lapse of time on the hot or cold surface or at any point within the body (temperature differentials; temperature distribution in the body)?

b What is the quantity of heat stored or lost in any interval of time after the beginning of the thermal-time cycle?

c In order to select the material best suited for any job, the tests with the model may be repeated, changing systematically the physical properties. This type of investigation can serve (*a*) to select one of a number of available materials; (*b*) to find the desired properties of a material to be developed for a certain purpose.

The applications are as follows:

(1) *Metal Heating.*
  (*a*) Heat-treatment (heating, quenching, annealing).
  (*b*) Cooling conditions in casting.
  (*c*) Heating for the change of form (rolling, forging).

(2) *Metal Melting.* Conditions in molten baths and containers (open hearth, aluminum).

(3) *Glass and Ceramics, Including Refractories.* Glass-melting tank, glass cooling and annealing, temperature distribution in ceramic bodies in kilns.

(4) *Chemical Industry.* Heating of material.

(5) *Industrial Furnaces.* Walls of intermittently operated furnaces; regenerator design and operation.

(6) *Building Walls.* Heating and cooling load of houses, ships, vehicles.

(7) *Refrigeration.*

(8) *Food Industries.* Canning industry; necessary heating and cooling time; baking and roasting.

(9) *Industrial Ovens.* Drying of cores, lumber, japanning.

(10) *Internal-Combustion Engines.* Pistons, cylinders, heads, accessories, valves, spark plugs, sprayers.

(11) *Vehicle Equipment.* Brake linings, shoes, and drums or wheels; relation between load-time cycle and reaching of dangerous temperatures; clutches (friction).

(12) *Plastic Materials.* Temperature-time conditions in the state of manufacture of rubber, synthetic resin.

(13) *Localized Heating.* Heat concentrated in a local zone and transmitted from there to the rest of the material by conduction (flame-hardening, induction-hardening, chemical reaction).

Incidentally, the same electrical model can be applied to certain types of problems other than heat: (*a*) Flow of fluids or mass transfer; (*b*) chemical diffusion.

3 Do investigations of walls composed of several layers offer additional difficulties?

A wall composed of several materials "in series" does not offer any difficulty. Thermal conductivity and electrical resistance (also thermal capacity and electrical capacity) for each experiment are in a given relation. For example, consider a wall composed of two layers. The inside layer is $4^1/_2$ in. thick, conductivity = 1, thermal capacity = 120; the outside layer is 9 in. thick, conductivity = 0.2, thermal capacity = 30. This wall might be represented by two groups of sections, the first group representing the inner layer, having a total resistance of 0.5 megohm, and a total capacity of 240 μf. The outer layer would be represented by the second group having a total resistance of

$$0.5 \times \frac{9}{4.5} \times \frac{10}{2} = 5 \text{ megohms}$$

and a total capacity of

$$240 \times \frac{9}{4.5} \times \frac{30}{120} = 120\ \mu f$$

4 Desirability of checking the method against actual temperature measurements.

The Johns-Manville Corporation carried out some experiments on an insulated furnace wall in its laboratories in Manville, N. J. The experiments were duplicated in the heat-transfer laboratory at Columbia University. A paper on this comparison will be published by C. E. Ernst and C. B. Bradley.

Steels and Alloys Developed for Use at Elevated Temperatures in Petroleum Refineries as Still Tubes and Other Parts

By B. B. MORTON,[1] NEW YORK, N. Y.

This paper outlines the steps which have been taken in the development of steels and alloys for use at elevated temperatures. Various tests, such as creep, rupture, and relaxation, which have been used in this development, are briefly discussed. A review is also given of the effects of the different alloying elements upon the steels and alloys.

THE development of steels for use at elevated temperatures, in connection with the refining of petroleum, has been guided by two main considerations, namely, that the metal shall have adequate mechanical strength to resist the forces acting upon it, and that it shall possess such a degree of resistance to corrosion and oxidation as to insure an economical life for the parts. It will be appreciated that the two considerations are interrelated to a certain extent for, if corrosion proceeds at a lively rate, there is likelihood of so thinning parts that mechanical failures can occur.

Strength of Materials

The fact that the steels in use were not wholly elastic at elevated temperatures was thrust upon the attention of refiners at an early date. The steels showed a lack of elasticity by enlargement of tubes and other cylindrical forms, as well as by a tendency of parts to elongate. This elongation was often marked in the case of heating-coil tubes which were found draped between supports, after some hours of service, in a manner resembling spaghetti.

As pressures were increased in the refining operations, the behavior of metals at elevated temperatures became of prime importance from the standpoint of safety to life and property. Developments in the chemical industries and in steam generation brought the need for knowledge bearing on this problem before larger groups than were encompassed in the petroleum industry. The result was that intensive studies of the characteristics of metals at elevated temperatures were undertaken throughout the world.

The results that poured in from the earlier investigations reminded one of the first meeting of the seven blind men of India with the elephant. Like the reports of the blind men, each set of results bore some grain of truth but in the composite the accounts appeared garbled and confusing. However, certain facts were established at an early date:

1 Above a certain temperature level, which appeared to vary for different steels, the metal ceases to act as an elastic material and acts more in the manner of a plastic, in that "creep," i.e., continuous elongation in the direction of maximum stress, takes place.

2 Breaks which are transcrystalline when the metals are ruptured in short periods of time at temperatures below about 700 to 750 F take place around grain boundaries when the temperatures are higher. The location of the break in respect to the crystals varies with the speed of rupture and the temperature.

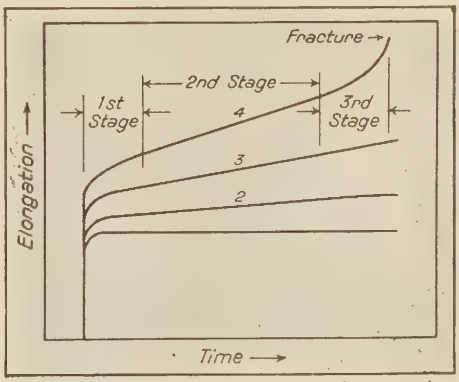
3 The transfer of major strength from the grain-boundary material (referred to as amorphous material) to the crystal apparently takes place in a gradual manner as the temperature is increased. A region of balanced strength of the two materials naturally exists at some temperature level. This point has been designated as the "equicohesive" temperature by Zay Jeffries(1),[2] and is of some significance in connection with the theory of the "creep of metals."

4 There appears to be no satisfactory correlation between any short-time tests and the results obtained from creep tests.

5 Within a certain temperature range, roughly, room to 700 F, the mechanical properties of steels used for design at room temperature can be applied, since the effects of carbon content and alloying elements, as well as of heat-treatment, can be felt and usefully employed within this range.

Creep Tests

With the thought fairly established that creep-test results were the only reliable means for determining the stresses to be imposed upon operating parts at elevated temperatures (above about 700 to 750 F), a great deal of creep testing was undertaken.



Oil and Gas Journal

Fig. 1 Typical Creep Curves

It was soon developed that three distinct phenomena of creep could be observed during testing of ductile material; otherwise, only two phases appear, Fig. 1. There is an immediate elongation of the metal which results in a permanent set, amounting in some cases to 3 to 5 per cent of the total elongation of the specimen during the test. Following the initial elongation, the specimen continues to elongate at a speed set by the load and tem-

[2] Numbers in parentheses refer to the Bibliography at the end of the paper.

perature. This portion of the curve is used to arrive at the rate of creep; the creep rate being the slope of this portion of the strain-time curve. When uniform creep has proceeded for some time, there often develops a third phase in ductile material in which the rate of flow increases rapidly and rupture occurs.

The appearance of the third phase of rapid creep in a specimen which has been creeping at some low rate indicates the necessity for long periods of testing of the specimens, and, in fact, has greatly influenced the art of creep testing. This third phase distinctly indicates the danger of determining and reporting creep rates based on tests of short duration, say 1000 hr.

Since the creep rate is taken as the slope of the line representing the second phase of flow of the specimen, the necessity for intensely close controls of conditions surrounding the specimens can be imagined. Decided changes in temperature must be avoided, as well as shock and vibrations. A sensitive method of measuring strain is naturally essential, since each point on the curve in the second phase is a point denoting some increment of strain.

Considering the variables present and the care to be exercised in making creep tests, the amount of good creep data available today is remarkable. In this connection, reference is especially made to work on creep data (2) compiled by a joint committee of this Society and the American Society for Metals.

The presentation of creep data is in a number of forms. Each form has some particular use which recommends it. The method used by Kanter and Spring (3) of plotting creep data on

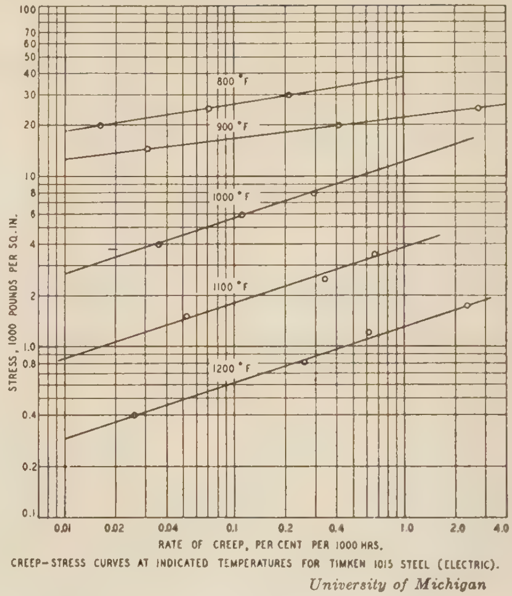

Fig. 3 Logarithmic Plotting of Creep Data

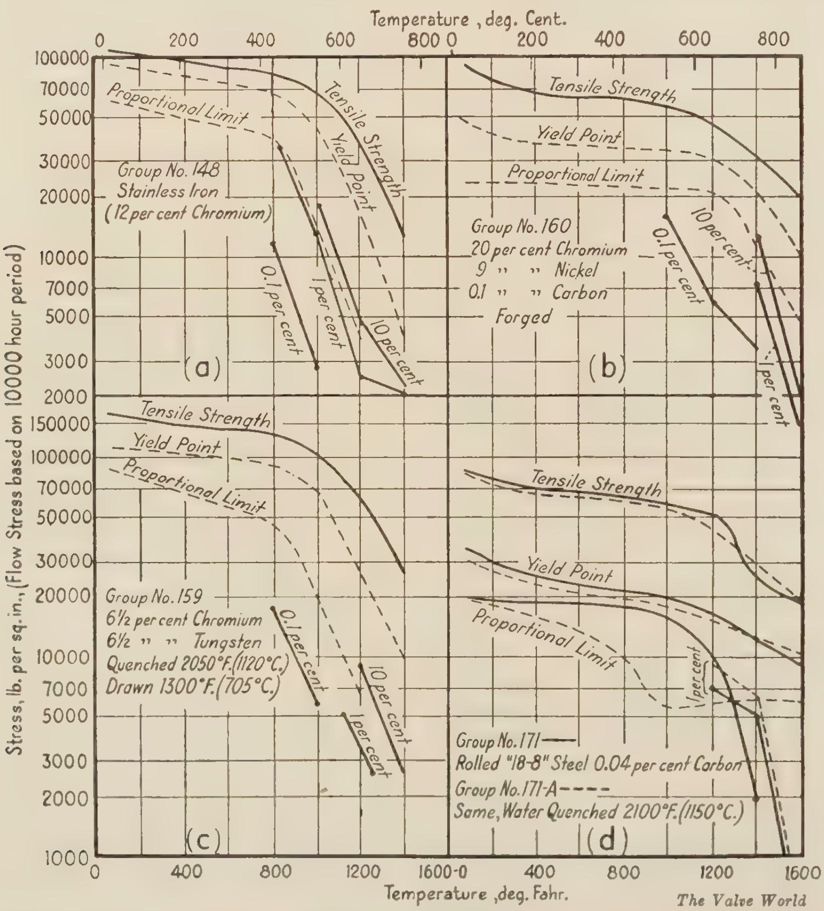

Fig. 2 Stress-Temperature Curves for "Long-Time" and "Short-Time" Tensile Tests, Plotted With Logarithmic Stress Ordinate

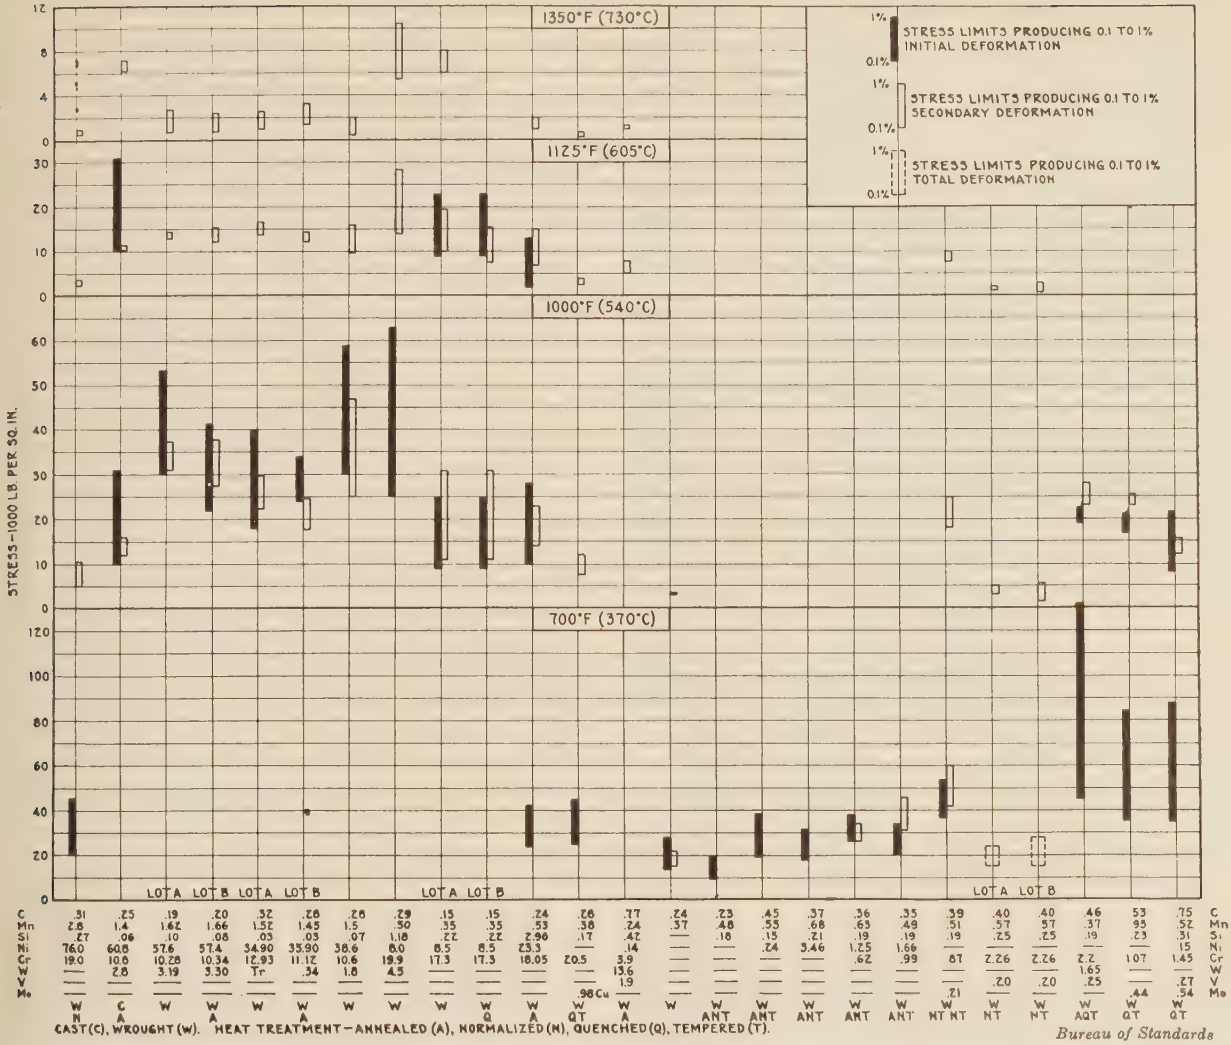

FIG. 4 COMPARISON OF ALLOYS ON THE BASIS OF STRESS PRODUCING DEFORMATION, BOTH INITIAL AND SECONDARY

the charts containing "short-time" test results, Fig. 2, was most useful at the time when the transition in thinking from the use of short-time results to creep results was taking place. The use of logarithmic stress ordinates enhanced the work of these distinguished authors.

The logarithmic plot of stress versus creep rates is widely used, and is particularly useful in indicating the effects of temperature on the rate of creep when several curves, representing results obtained at different temperature levels, are presented in a graph, as in Fig. 3.

The initial deformation which occurs in the creep specimen is often ignored in presenting creep data. In some cases, this deformation may be the controlling factor. Some work done at the Bureau of Standards, Fig. 4, indicates between 0 and 1 per cent the initial deformation to be expected from a given stress load. The secondary deformation (creep rate) is also given.

RUPTURE TESTS

Creep testing is a precision method, and, when properly conducted, should give precision results. Such results are necessary where close tolerances will exist in the parts used at elevated temperatures. There is an enormous field in petroleum refineries and elsewhere where close tolerances are not required and where slight distortion of parts is of no consequence. Where such conditions prevail, the rupture tests are receiving much attention, and appear to fulfill a distinct need. In the case of heating-coil tubes, the rupture test is considered by many as being more useful than creep testing, since it outlines the regions of stress and temperature within which actual failures may be

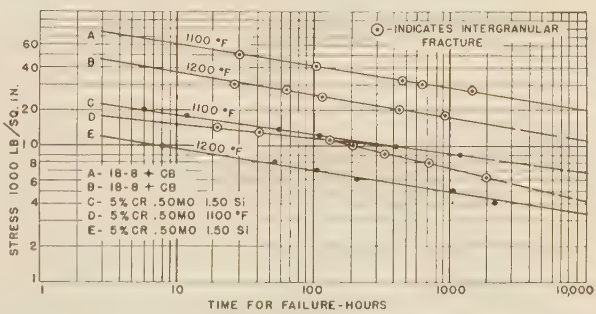

FIG. 5 RESULTS FROM RUPTURE TESTS

expected; and, further, it indicates whether or not a ductile type of failure will occur.

As the name implies, "rupture tests" are made by applying varying loads to a number of specimens held at a constant temperature until rupture occurs. The time and stress required to produce failure in each bar is plotted. When plotted on log-log paper a straight-line relation often results, Fig. 5. Elongation accompanying the rupture is often recorded and throws light on the ductility existing at the time of rupture.

A considerable literature bearing on rupture tests is being accumulated, and an accurate evaluation of the merits of such tests can probably be made in the near future. To one interested in the design of refinery equipment and conscious of the dangers attending failure of such equipment, there will probably be a tendency to use creep data in conjunction with data from rupture tests. The writer recalls the satisfaction gained from studying the early work of Messrs. Clark and White (4), dealing with the rupture tests made using tubing samples. Anything these early tests may have lacked in scientific nicety they made up in the assurance they gave that a certain stress acting at a given temperature over a period of time would or would not probably result in rupture. The data from the tube-rupture tests were of particular use in heating-coil investigations in connection with some creep data available at the time.

Relaxation Tests

The characteristic of the creep of many steels of taking a large permanent set when first loaded at elevated temperatures can be most annoying in the case of bolts, since this initial "strain" can release a definite amount of stress. Leakage of the joint may result from this so-called "relaxation" of the bolt. A special technique and apparatus is employed in studying the relaxing properties of different materials. It would appear from studies reported to date that structure and dispersion of reaction products in the steel are controlling factors in the tendency toward relaxation of a steel.

* * * *

From the preceding discussion, it is developed that the creep tests, rupture tests, and relaxation tests are employed in evaluating steels for use at temperatures above about 700 F. Below this temperature (actually 650 F), it is generally recognized that steels can be treated as elastic bodies, and design can be based on using a factor of safety in connection with the ultimate strength as determined in short-time tests. Reference may be made to the A.P.I.-A.S.M.E. code (5) for details in this connection.

Chemical Composition

As previously pointed out, steel to be used in refinery equipment at elevated temperatures often must possess resistance to corrosion and oxidation. Corrosion resistance is usually conferred on steels by alloying elements into their composition. Steel is also often protected from corrosion by cladding with suitable alloys and elements. There follows a brief discussion of certain elements used in connection with the steels employed in parts of refinery equipment.

Chromium. Chromium is probably the most useful element used to protect refinery equipment, operating at elevated temperatures, against corrosion. As an alloying agent, chromium forms carbides and also dissolves in ferrite. It possesses the useful property of taking upon itself a dense, closely adhering scale of oxide or sulphide which acts as a barrier to further attack. It confers this immunity to attack upon iron and nickel with which it is alloyed.

Chromium per se does not appear to affect appreciably the creep resistance of a steel within the usual commercial limits for this element. The benefits to be derived by the presence of chromium in resisting sulphur are shown in Fig. 6.

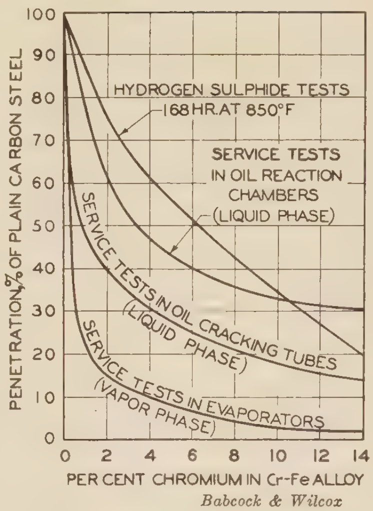

Fig. 6 Effects of Chromium in Retarding Sulphur Attack

Molybdenum. Molybdenum, due to its potent effect upon the creep resistance of steel, is probably the most widely used alloying element entering refinery equipment which operates at temperatures of 700 to 1300 F. It is added to the chromium alloys containing 2 to 10 per cent chromium to inhibit temper brittleness and to improve creep resistance, and is effective in concentrations of 0.25 and 0.5 per cent. It is added in amounts up to 4 per cent to the 18 per cent chromium-8 per cent nickel alloys to improve the corrosion resistance to certain organic acids encountered in refining.

Tungsten. The element tungsten is also one of the carbide formers. It shares with molybdenum the property of rendering chrome steels less susceptible to temper brittleness. The presence of tungsten in steels enhances the resistance to creep.

Nickel. Nickel dissolves in ferrite and does not form carbides. This element does not add materially to the creep strength or corrosion resistance of the low-chromium (1 to 3 per cent chrome) alloys when it is used in low concentrations. When present in percentages greater than about 7 per cent in the presence of sufficient chromium, the useful, austenitic chromium-nickel alloys are formed, among which may be listed the 18 per cent chromium-8 per cent nickel, and the 25 per cent chromium-20 per cent nickel alloys.

Nickel in concentrations of 12 to 80 per cent is an important element in the heat-resisting alloys.

The chromium alloys rendered austenitic by the addition of nickel have the lowest creep rates at temperatures above about 1200 F. The structure of the austenite appears to account for the low creep rates.

Silicon. Silicon additions (up to 3 per cent) to the chromium and to the austenitic chromium-nickel steels appear to improve somewhat the resistance to attack by sulphur compounds and to improve greatly the resistance to oxidation. This element does not appear to improve creep resistance.

Carbon. Carbon, while having a profound effect upon the mechanical properties of steels at temperatures below about 900 F, does not appear to increase the creep resistance above that temperature. In general, low-carbon values (0.15 to 0.2 per cent) appear desirable in parts to be welded and worked. The carbon content of castings will usually exceed that of wrought materials of the same composition.

Application

The objects of the studies outlined in the preceding discussion have been to evolve steels and alloys for use at temperatures in excess of about 700 F. It has been indicated that chromium confers upon a steel base a resistance to sulphur attack and to oxidation. Also, that molybdenum, tungsten, nickel, and other elements can be used to improve the resistance to creep of steels and alloys. Mention will be made of the various alloys now in common usage. Tables 1, 2, and 3 list the alloys and indicate specifications covering the materials.

Carbon-Molybdenum Steels (1/2 Per Cent Mo). These steels find wide applications as tubes in heating coils where the metal temperatures will not exceed about 1050 F, and where better creep properties are required than are obtainable from carbon steels. No particular improvement in corrosion resistance can be expected. These steels are also employed as parts of vessels and piping.

Chromium-Molybdenum Steels. A useful series of steels containing from 0.8 to 10 per cent chromium with 0.15 to 1.3 per cent molybdenum have been evolved for use in refineries. These alloy steels make use of the chromium to resist sulphur attack and molybdenum to avoid temper brittleness, as well as to confer good creep properties.

On the lower end of this series, is found the alloy steel SAE 4140 (0.8 to 1.1 per cent chromium, 0.15 to 0.25 per cent molybdenum) which is widely used as a bolting material at elevated temperatures.

Steels containing 1 to 3 per cent chromium with 1/2 to 1 per cent molybdenum find use as the service becomes more severe from a standpoint of corrosion or oxidation.

The 4 to 6 per cent chromium-0.5 per cent molybdenum steel is widely used in heating coils and other locations where a good order of resistance to sulphur attack and to oxidation is required. In refineries, tubes of this material are used to approximately 1300 F. This alloy must be viewed as a very important contribution to the art of refining.

Additional amounts of chromium, up to about 10 per cent, are used in this series of alloys to give greater resistance to sulphur attack.

Silicon appears in the composition of many of the steels of the chromium-molybdenum series. The silicon improves the resistance to oxidation.

Alloys of 11 to 14 Per Cent Chromium. The resistance to sulphur obtained from chromium is taken advantage of in the use of the 11 to 14 per cent chromium alloys to protect reaction vessels. These alloys are applied as liners of vessels serving at elevated temperatures. The liners are welded, using an 18 per cent chromium-8 per cent nickel or a 25 per cent chromium-20 per cent nickel rod. The application of these liners, which serve as the "corrosion constant" required in design to meet the A.P.I.-A.S.M.E. Code (5), is in itself an art and has been thoroughly discussed in the literature (6, 7, 8).

Alloys of 18 Per Cent Chromium-8 Per Cent Nickel. These alloys, with additions of stabilizers as titanium and columbium and often with an addition of 2 to 4 per cent molybdenum, play an important part in refinery metallurgy due to their high order of resistance to sulphur and to good creep resistance.

The addition of molybdenum renders these alloys resistant to organic acids, such as naphthenic (against which the 18-8 is not especially resistant) and phosphoric, as well as other acids which are corrosive at high temperatures.

The 18-8 alloy has shown its worth against phenols in various forms. It is so highly resistant to sulphur at temperatures up to 1300 F that only slight corrosion is noted after several years' service. In this connection, Jamison reports (9), Case 1145, negligible corrosion of KA_2S (18 per cent chromium-8 per cent nickel alloy) in 50,000 hr. The crude used to furnish the feed stock was reported as West Texas Panhandle with 1.5 per cent sulphur. The sulphur content of the cracking-unit fresh feed is not given, but, judging from the attack upon the carbon-steel tubes, the feed was corrosive.

TABLE 1 LIST[a] OF A.S.T.M. SPECIFICATIONS FOR TUBES AND PIPES

Specification number	Materials covered
ASTM A-53-36	Seamless steel pipe
ASTM A-83-38T	Boiler tubes, seamless steel, and open-hearth iron
ASTM A-106-39	Seamless-steel pipe for high-temperature service
ASTM A-120-36	Seamless black and galvanized pipe for ordinary uses
ASTM A-158-38T	Seamless alloy-steel pipe for high-temperature service
ASTM A-161-37	Seamless-steel cracking-still tubes for refinery service. (Including carbon-0.5 per cent molybdenum)
ASTM A-179-37	C.D. steel heat exchanger and condenser tubes for refinery service
ASTM A-187-38	C.D. heat exchanger and condenser tubes 5 per cent chrome; 5 per cent chromium with molybdenum; 5 per cent chromium with tungsten
ASTM A-188-38	Seamless cracking-still tubes 5 per cent chromium; 5 per cent with molybdenum; 5 per cent with tungsten
ASTM A-192-38T	Seamless boiler tubes for high-pressure service
ASTM A-199-39	Seamless C.D. intermediate-alloy heat exchanger and condenser tubes
ASTM A-200-39	Seamless intermediate alloy-steel cracking-still tubes
ASTM A-206-39T	Seamless carbon-molybdenum alloy-steel pipe for high-temperature service
ASTM A-209-38T	Seamless carbon-molybdenum alloy-steel boiler tubes (Grades T-1 and T-1a)
ASTM A-210-38T	Seamless medium-carbon-steel boiler tubes (grade C)
ASTM A-213-39T	Seamless alloy-steel boiler and superheater tubes; low, medium, and high alloys
ASTM A-158-38T (P8a, b, c)	Seamless nickel-chromium austenitic alloy-stee cracking-still tubing, 18-8

TABLE 2 A.S.T.M. SPECIFICATIONS COVERING STEEL PLATE FOR ELEVATED-TEMPERATURE SERVICE

Specification number	Materials covered
ASTM A-7	Specifications for structural steel for bridges (plates only)
ASTM A-10	Specifications for mild-steel plates
ASTM A-30	Specifications for boiler and firebox steel for locomotives
ASTM A-70	Specifications for carbon-steel plates for boilers and other pressure vessels for stationary service
ASTM A-78	Specifications for steel plates for structural quality for forge welding (grades A and B)
ASTM A-113	Specifications for structural steel for locomotives and cars (plates for cold pressing only)
ASTM A-129	Specifications for open-hearth iron plates of flange quality
ASTM A-149	Specifications for high-tensile-strength carbon-steel plates for pressure vessels (2 in. and under in thickness)
ASTM A-150	Specifications for high-tensile-strength carbon-steel plates for fusion-welded pressure vessels (over 2 to 4 in., inclusive, in thickness)
ASTM A-201	Specifications for carbon-silicon-steel plates for ordinary tensile ranges for fusion-welded boilers and other pressure vessels, firebox and flange grades
ASTM A-202-39	Specifications for chromium-manganese-silicon (CMS) alloy-steel plates for boilers and other pressure vessels
ASTM A-203-39	Specifications for low-carbon nickel-steel plates for boilers and other pressure vessels
ASTM A-204-39	Specifications for molybdenum-steel plates for boilers and other pressure vessels
ASTM A-167-39	Specifications for corrosion-resisting chromium-nickel-steel sheet, strip, and plate

TABLE 3 A.S.T.M. SPECIFICATIONS COVERING CAST STEELS FOR USE AT ELEVATED TEMPERATURES

Specification number	Materials covered
ASTM A-95-40	Specifications for carbon-steel castings for valves, flanges, and fittings for high-temperature service
ASTM A-157-40	Specifications for alloy-steel castings for valves, flanges, and fittings for service at temperatures from 750–1100 F; carbon-molybdenum; chrome-molybdenum; 13 per cent chromium; nickel-chromium-molybdenum; 18-8; 25 chrome-20 nickel covered
	Welding Grades
ASTM A-216-40T	Specifications for carbon-steel castings suitable for fusion welding for service at temperatures up to 850 F (tentative)
ASTM A-217-40T	Specifications for alloy steel suitable for fusion welding for service at temperatures from 750–1100 F (tentative); carbon-molybdenum; nickel-chromium-molybdenum covered

Apparently, 18-8 is an excellent material for use as heating-coil tubes if a clean and refractory feed stock can be supplied. The alloy apparently should not exceed 1300 F in metal temperature during operation. The excellent corrosion resistance of this alloy has indicated its use as the protecting liner for vessels and pipes. Its coefficient of thermal expansion, which is approximately 50 per cent greater than that of steel, has somewhat limited its use in this service.

The failure of tubes of 18-8 are often spectacular, in that there occurs a violent rupture. The ruptured tube frequently shows little or no ductility in the region of the break. An explanation for the tendency for sudden rupture is that failure in many cases

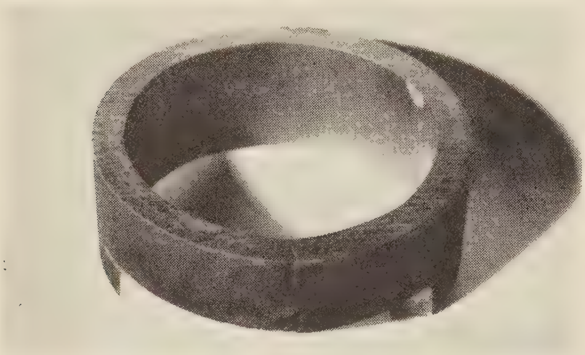

Fig. 7 Crack in Wall of an 18-8 Tube
(The crack started on the outside and has not fully penetrated the wall.)

appears to result from a crack which originates at the outer wall and works inward. The origin of the crack at the outer skin is something of a mystery. It may be due to a fluctuating heat load that sets up a fatigue type of stress. Fig. 7 shows a section of wall of an 18-8 tube. The crack developed from the outer wall and was caught before the tube could rupture, that is, before it reached the inner wall.

Heat-Resisting Alloys

There is a wide variety of compositions used in heat-resisting alloys. One of the most common varieties used in oil refineries contains about 28 per cent chromium with 12 per cent nickel. This composition appears to give good economical life in such parts as tube supports, damper parts, and other parts which operate at temperatures of 1600 to 1800 F.

Much of the 25 per cent chromium-20 per cent nickel alloy, in both wrought and cast form, is used for temperatures of 1800 to 2000 F. The material has good resistance to oxidation and to sulphur in the form of the oxide.

It should be noted that, while many of the heat-resisting alloys can resist the effects of sulphur dioxide at high temperatures, they often can be destroyed by hydrogen sulphide at the same temperature. A firing system which permits unburned fuel to enter the firebox can set up conditions to form hydrogen sulphide from sulphur dioxide and can result in damage to the heat-resisting alloys. Sodium salts in a fuel can be damaging to heat-resisting alloys.

While there is a variety of compositions of heat-resisting alloys, they will be found to contain chromium to provide oxidation resistance and nickel to give load-carrying ability at high temperatures.

Calorizing, a method of placing an aluminum-aluminum oxide coating on a metal surface, is often invoked to protect parts operating at elevated temperatures. This form of coating is highly protective to the metal part and prevents or greatly retards oxidation and sulphur attack. Calorizing appears especially applicable to protection of bolts serving under conditions conducive to oxidation of the bolt material.

The decided effect of temperature upon the strength of heat-resisting alloys at elevated temperatures (1000 to 2000 F) can be seen from Fig. 8.

Heat-Resisting Cast Irons

A considerable quantity of cast irons are used to resist moderate temperature conditions (700 to 1200 F) as tube supports, chiefly in the convection section of heating coils.

Desirable properties in cast irons when used as supports in fireboxes, burner parts, etc., are low rates of growth, resistance to oxidation, and a good order of strength.

Ni-Resist[3] cast iron, containing approximately 15 per cent nickel, 6 per cent copper, and 2 to 4 per cent chromium (10), has given good service as tube supports and as dampers. This alloyed iron shows low rates of growth at temperatures up to 1200 to 1300 F.

Special processed nickel-chromium irons have entered refinery

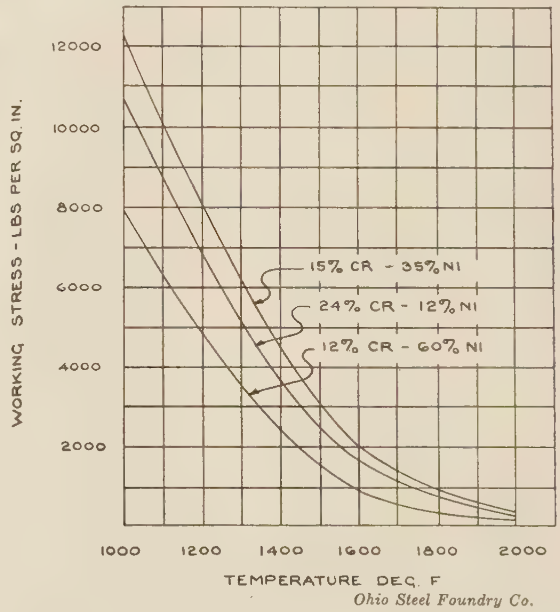

Fig. 8 Working Stresses for Some Heat-Resisting Alloys

service in large tonnage as tube supports. These irons contain 0.8 to 1.5 per cent nickel, 0.3 to 0.9 per cent chromium with 3.2 to 3.5 (maximum) carbon values, depending upon grade (11). In tests simulating conditions of furnace heating and cooling, these irons showed a remarkable resistance to growth and scaling, especially when considering the low alloy contents. The nickel appeared to induce a densely adhering scale which acted to protect the underlying metal.

There is often a temptation to use cast irons as furnace parts where the true nickel-chromium heat-resisting alloys are indicated. Yielding to such a temptation has rarely resulted in any benefit or saving.

Conclusions

In this paper, which is historical in nature, the purpose has been to show that, at an early date in refinery circles, it was noted that metals behaved in the manner of a plastic at certain

[3] Registered trade-mark.

temperature levels. Based on this observation, an extensive study of the behavior of metals at elevated temperatures was undertaken, often in collaboration with other industries. Creep tests, rupture tests, relaxation tests, and variations of these tests were developed, and results useful to industry have accumulated.

The use of chromium to confer upon steel resistance to oxidation and sulphur attack has been widely exploited, and a series of alloys are available today containing 1 to 28 per cent chromium, generally with other alloy elements present.

Molybdenum is added to a wide range of steels containing carbon and chromium to improve the resistance to creep. In the case of the chromium steels, the presence of molybdenum suppresses the tendency toward temper brittleness. It is added to 18-8 alloy to give greater resistance to certain agents, chiefly organic acids occurring in refinery operations.

Nickel, in amounts of 8 per cent and above, is added to the chromium-containing alloys to form the well-known austenitic alloys. These alloys possess a high order of resistance to sulphur at elevated temperatures. They also possess the best load-carrying ability at elevated temperatures (1100 F and above) of available commercial alloys.

A wide variety of chromium-nickel alloys are used as heat-resisting parts of furnaces. The 28 per cent chromium-12 per cent nickel alloy appears popular for this service.

Experimental Study, Feedwater Treatment for 1400-Lb Boiler Operating Pressure

By D. C. Carmichael,[1] Wilmington, Del.

Study has shown that the future steam and electrical loads of the Dye Works of the author's company would be most economically supplied by a 1400-psi boiler-and-turbine installation, exhausting directly into the plant process mains, without the use of evaporators as are now used at the Deepwater plant of the Deepwater Operating Company. The development of a satisfactory water-purification system to permit 100 per cent treated soft water to be used in a 1400-lb boiler would eliminate the necessity of using intermediate evaporators with their consequent maintenance and loss of thermal potential. It has been calculated in connection with the study of increased steam and electrical capacity for the Dye Works that the elimination of the evaporators would permit the generation of up to 8000 kw of electricity from the same steam. Additional savings in maintenance would be realized. This paper reviews the various steps undertaken in developing, installing, and operating the experimental water-treatment system, followed later by the installation of a 1400-lb experimental boiler, operating with a heat absorption of 100,000 Btu per sq ft per hr. A 400,000-lb per hr boiler to operate at 1400 psi with 100 per cent treated soft water has been purchased and will start operation in January, 1942.

The present steam and electrical load of the Dye Works of the author's company is largely supplied from the Deepwater plant of the Deepwater Operating Company. The boiler units at this plant generate steam at 1250 psi, which is delivered to a 12,000-kw turbine. The turbine exhausts at approximately 310 psi into high-pressure tubular evaporators, which in turn generate steam at 180 psi from the Dye Works' treated water. The turbine exhaust is condensed in the evaporators, after which it is returned to the 1250-lb boiler-feedwater system.

The development of a satisfactory water-purification system to permit treated water to be used in a 1400-lb-pressure boiler would eliminate the necessity of using intermediate evaporators with their consequent maintenance and loss of thermal potential.

Course Pursued in Study

An investigation was made of the successful operation of two 900-psi plants, using 100 per cent make-up, and it was believed that our problem was not materially different. However, reliable design information on the treatment equipment and process which would be necessary for the Dye Works could not be obtained without fairly large-scale experiments.

Laboratory work was carried on with the available raw-water supply, using various treatments of caustic soda, ferric sulphate, and magnesium sulphate for color and silica removal. Typical analyses of the raw water are shown in Table 1.

The results indicated that color and silica could not be effectively removed by a single treatment but required two stages, the first at a pH of approximately 5 for color removal, and the second at a pH of approximately 10 for silica removal.

The experimental or semiworks equipment first proposed for color and silica removal consisted of batch settling tanks, equipped with decant pipes and floats so that, after adding the treating chemicals, agitating, and allowing the water to settle, the clear water would be decanted to a gravity filter.

Prior to the final design of the equipment for batch treatment, the use of continuous settling equipment, utilizing upward flow through a sludge blanket, was suggested, and further laboratory work was carried out. The results again indicated that a two-stage treatment was necessary for color and silica removal, but the important finding was that a continuous, rather than batch, system was feasible.

Based on the laboratory work, the semiworks plant for color and silica removal was designed as a continuous system of treating and settling, followed by filtration. The schematic layout of treatment equipment is shown in Fig. 1, and design details in Fig. 2.

The continuous settling equipment was so designed that the water and coagulating chemicals were thoroughly mixed by mechanical agitation in the lower part of the tank, then passed upward through a cone partition in the upper part of the tank. This design permits the settled water to pass upward through a layer of sludge before reaching the take-off pipe. At 3 gpm flow the volume of the mixing chamber allowed for 200 min mixing time, and the settling chamber, or cone, was of sufficient volume to allow for 50 min detention period. Later, the flow rate was increased to 7 gpm with satisfactory results.

Siphons were installed approximately 15 in. below the sludge level in each case, and continuous blowoff of sludge was regulated so as to keep the sludge level below the overflow openings.

The semiworks equipment was started June 16, 1938, and continued in operation until November 25.

Operating data and tests were taken every 2 hr and recorded on the log-sheet forms. At intervals of 2 to 5 days, samples of water were collected and sent to the laboratory for gravimetric silica analyses. Each sample was given a run number. The average, maximum, and minimum silica contents of 28 run sam-

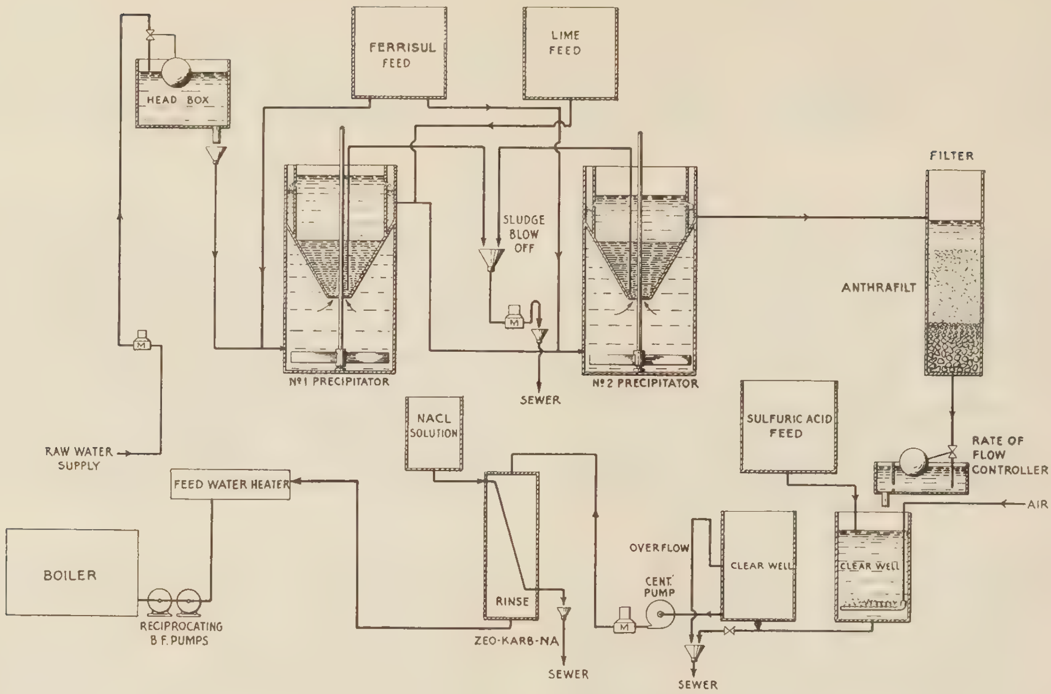

Fig. 1 Schematic Layout of Water-Treating Unit

ples leaving No. 1 settling tank after color removal were 8.7, 13.5, and 2.5 ppm, respectively, and similar averages in the filtered water were 2, 5.2, and 0.4 ppm, respectively.

The silica content of the treated water was somewhat affected by the operating difficulties experienced in the control of the chemical feeders, this varying from shift to shift. During the week, Monday to Friday, inclusive, full-time operators were on duty from 8:00 a.m. to 12:00 midnight, but from 12:00 midnight to 8:00 a.m., the system was operated with very little or no attention. Over the week ends from 4:00 p.m. Friday to 4:00 p.m. Sunday, the operation of the system was discontinued, the only part in operation being the agitators in the mixing chambers. This type of operation, while keeping the labor requirements at a minimum, tended toward occasional erratic results on silica removal.

Prior to September 19, Ferrisul, which is anhydrous ferric sulphate, was used as the coagulant. During the remaining part of the test period, chlorinated ferrous sulphate in chemically equivalent amounts was used in place of Ferrisul. The results as to color and silica removal were the same with either coagulant.

After filtration, the pH value of the water was approximately 10 and, to prevent deposition of $CaCO_3$ on the softener beds, the pH value was lowered to 7.5 by the addition of sulphuric acid.

From the filtered-water storage tanks, the water was pumped to zeolite softeners where the hardness and total dissolved solids were reduced. The softeners consisted of two pressure shells, each 12 in. in diam and approximately 5 ft high.

The first softener was charged with Zeo-Karb, a carbonaceous zeolite and the second with De-acidite, a granular organic compound.

During the softening process, the cations (Ca, Mg, and Na) are replaced by H ions by exchange process in the Zeo-Karb unit. The effluent from this unit contains H_2CO_3, HCl, and H_2SO_4 due to replacement of the cations with hydrogen. This acid water then flows directly to the second or De-acidite unit where the HCl and H_2SO_4 are absorbed; thus, removal of the hardness and lowering of the total dissolved solids are accomplished.

TABLE 2 ANALYSIS OF WATER SAMPLES FROM EACH STEP IN WATER-TREATING SYSTEM

Results as ppm	Raw water	From No. 1 precipitator	From No. 2 precipitator	From effluent gravity filter	From effluent de-mineralite unit
Silica	10.0	9.0	1.8	1.5	1.5
Iron as Fe	0.8	6.0	0.4	0.1	0.1
Calcium bicarbonate as $CaCO_3$	..	..	..	..	3.7
Calcium carbonate as $CaCO_3$	..	..	14.0	12.0	..
Calcium chloride	..	..	43.4	43.4	..

Sodium chloride	19.8	19.8	19.8	19.8	3.9
Sodium sulphate	21.7	21.7	21.7	21.7	.5
Total dissolved solids	87.5	116.1	232.9	230.2	19.7
Turbidity	35	20.0	15.0	0	..
Color	Turbid	15	10	10	..

The Zeo-Karb bed was regenerated with H_2SO_4 and the De-acidite with soda ash.

The complete analysis of a set of water samples collected through the water-treatment system is shown in Table 2.

Treatment Costs

The treatment costs per million gallons were as follows:

Color removal	$ 1.90
Silica removal	16.10
Acid treatment	1.06
Zeo-Karb softening	26.20
De-acidite softening	56.60
Total	$101.86

These costs are based on using chlorinated ferrous sulphate and sulphuric acid in the color-removal treatment, chlorinated copperas and lime in the silica-removal treatment, sulphuric acid for lowering the pH value after filtration, sulphuric acid for re-

generation of the Zeo-Karb unit and soda ash for regeneration of the De-acidite unit.

Evaporation Tests

In order to study the effect of the water treatment on scale formation, arrangements were made with the National Aluminate Corporation of Chicago to ship 250 gal of the final treated water in stainless-steel drums to its plant for evaporation in its laboratory boiler. Heating of the water was by means of electrical resistance elements inserted in the heating or boiler tube. This tube was 12 in. long and $1^1/_2$ in. outside diam.

The duration of the test was for a period of 294 hr, during which time, 200 gal of water were evaporated. An operating pressure of 1000 psi was maintained throughout the test, and the heat input was 35,000 Btu per sq ft per hr. The water was preheated to 210 F before being delivered to the boiler.

Trisodium phosphate was fed with the water in order to precipitate any residual hardness not removed by the zeolite softeners.

After completion of the test, the heating tube was removed and the adhering deposit examined physically and chemically. The physical examination showed a coral-like formation approximately 0.1 in. thick. The deposit was very soft when wet and could be readily crushed between the fingers. Chemical analysis showed it to consist entirely of calcium and magnesium phosphates.

Table 3 shows the analysis of "treated water," "boiler water," and "deposit on tube," as made in the National Aluminate Corporation's laboratory. Views of the boiler tube before and after the evaporation test are shown in Figs. 3 and 4.

The conclusions of part 1 of this experiment were as follows:

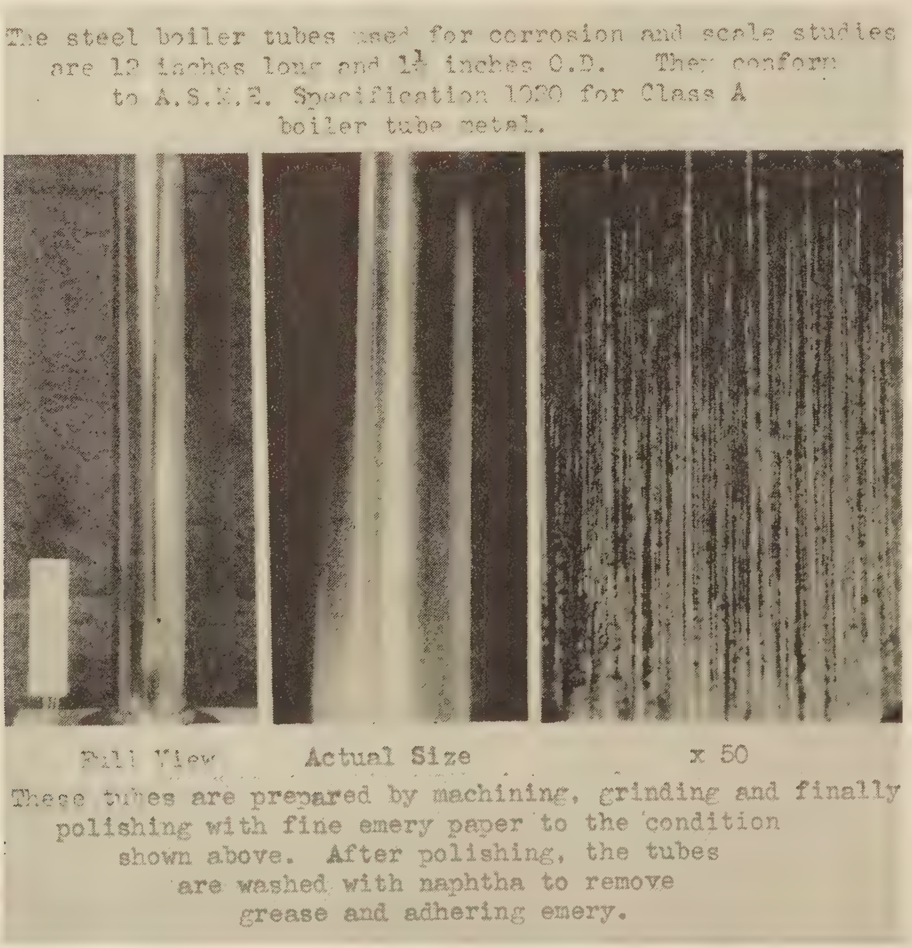

Fig. 3 Boiler Tube Before Evaporation Test

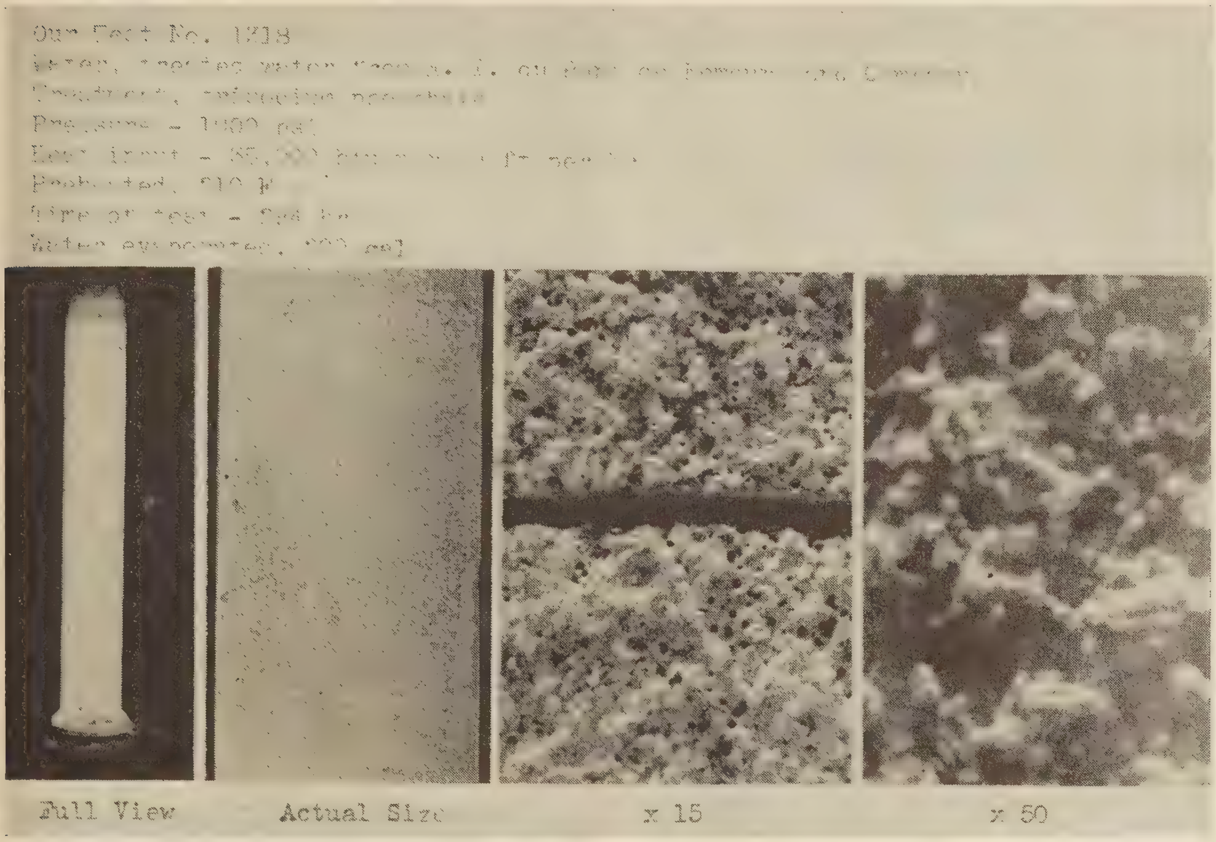

FIG. 4 BOILER TUBE AFTER EVAPORATION TEST

1 The silica content was lowered to 2 ppm or less.

2 Evaporation tests at 1000 psi working pressure and a heat input of 35,000 Btu per sq ft per hr showed no detrimental scale formation.

3 Before any definite conclusion was reached to construct a 1400-lb boiler, operating with 100 per cent make-up water, further evaporation tests should be made in an experimental boiler to be operated at 1400 psi and heat inputs up to 100,000 Btu per sq ft per hr.

Following the completion of part 1 of the experimental program, contact was made with several boiler companies regarding the design of an experimental boiler unit. This boiler consisted of an oil-fired unit for operation at a maximum pressure of 1400 psi, with a heating surface of 4.45 sq ft, and was enclosed in a suitable refractory-lined, steel-encased setting for oil burning. The oil burner was of the air-atomizing type, using oil from existing oil lines located in the boiler room and air from a low-pressure motor-driven blower.

Feedwater was supplied to the boiler room from the treating equipment previously described. The only major change made in the feedwater treatment was the use of Zeo-Karb zeolite on the sodium cycle rather than employing the two types of zeolite already discussed.

The design of the boiler allowed for operation at 1400-psi pressure with a heat input up to and including 100,000 Btu per sq ft per hr.

Figs. 5, 6, 7, and 8 show construction of the boiler pressure parts and furnace. Fig. 9 shows the boiler feed pump which is a motor-driven duplex unit.

BOILER OPERATION

The boiler was placed in operation on June 1, 1940, maintaining the gas temperatures entering and leaving the tubes as given in the expected performance, Table 4. It was not possible to obtain the desired heat absorption of 100,000 Btu per sq ft per hr and adjustments were made in the fuel and air. To obtain the mentioned heat absorption it was necessary to maintain a gas temperature of approximately 2900 F entering, and 2400 F leaving the tubes. This temperature greatly exceeded the gas temperature as originally calculated, and it was recommended that the furnace be rebuilt using brick to withstand temperatures of 3100 F.

The boiler unit was taken out of operation on June 7, and the furnace rebuilt by The Babcock & Wilcox Company. During the rebuilding, the furnace arch was changed from a suspended to a sprung arch. Operation of the boiler unit was resumed on June 17, at the expected heat absorption. Table 5 shows optical-pyrometer observations together with other related data as periodically collected by The Babcock & Wilcox Company. The

TABLE 4 EXPECTED PERFORMANCE OF EXPERIMENTAL BOILER UNIT

Temperature of water entering boiler, F	230
Steam generated, lb per hr	479
Heat absorption, Btu per sq ft per hr	100000
Total air, per cent	180
Oil fuel, lb per hr (18,500 Btu per lb)	258
Flue gas, lb per hr	6650
Input from fuel, Btu per hr	4775000
Boiler-tube surface, sq ft	4.26
Total absorption, Btu per hr	426000
Btu available per lb gas, Qg	630
Moisture in flue gas, per cent	5
Adiabatic gas temperature, F	2340
Gas temperature entering tubes, F	2240
Gas temperature leaving tubes, F	2060

maximum brick temperature was 3188 F, which would have resulted in forced shutdown of the boiler if rebuilding of the furnace had not been carried out at the first indications of distress. Fig. 10 shows the location of the thermocouple and optical-pyrometer observations as given in Table 5.

Fig. 10 Location of Thermocouple and Optical-Pyrometer Observations as Given in Table 5

Fig. 11 is a diagrammatic arrangement, showing the manometer elevations and method of measuring steam output and blowdown water from the boiler. The manometers were installed by The Babcock & Wilcox Company and were used in measuring the circulation through the boiler tubes and also the water-to-steam ratios by weight at the outlet of the tubes.

A number of operating difficulties were experienced in maintaining continuous boiler operation at the rated heat input. Metering facilities of the condensed steam were found inadequate, due to the low steam flow, and arrangements were made to weigh separately the condensed steam and blowdown water. This change was found very satisfactory and, likewise, gave accurate means for calculating the heat absorption.

Operating difficulties were also experienced with the boiler feed pumps and, at frequent intervals, it was necessary to repack the pumps and finally install stainless-steel plungers. A number of changes were also made in the lubrication and method of its application.

Data on the boiler operation were taken every 2 hr by the shift operators. A weekly summary of the daily average data on the furnace and evaporating conditions is given in Table 6.

Water Treatment

Throughout the operation of the boiler, 100 per cent treated make-up water was fed from the treating equipment as previously described. All stainless or monel-metal containers were used in collecting water samples for silica analyses, thus avoiding any such possible contamination as existed with Pyrex glassware.

A Diller photoelectric-cell color comparator was employed in all silica testing, thus enabling the operator to make frequent checks and changes in the chemical treatment when necessary. This method of testing for dissolved silica was a decided improvement over the visual color comparisons or gravimetric analyses.

Hourly tests were made on water samples for chemical control in the water-treatment plant. A weekly summary of these tests is given in Table 7.

A supplementary chemical treatment, consisting of definite amounts of sodium sulphite, trisodium phosphate, caustic soda and, occasionally, soda ash, was pumped as a single solution direct to the boiler. This treatment was used chemically to fix any traces of oxygen in the feedwater not removed in the deaerating heater and also to precipitate any hardness remaining in the feedwater as a tricalcium phosphate.

Analyses of the boiler blowdown water were made at least once every 4 hours to control the supplementary chemical treatment. Composite weekly samples of blowdown water were likewise sent to the laboratory for complete analyses.

TUBE EXAMINATION

On August 14, after 60 days of operation of the experimental boiler, one of the tubes blistered and failed. Examination of the tubes, after they had been removed, showed that they were blistered at several points along the wall of the tube and on the side facing the fire. These tubes were cut up and the deposits were analyzed. Microscopic examination was also made of the tube metal.

Figs. 12 to 17, inclusive, are views of the tubes in the furnace and after being removed and sectioned.

Chemical and X-ray analyses were made of the deposits, the chemical analyses being given in Table 8 of samples Nos. 1 to 5, inclusive.

Although many opinions were expressed as to the possible cause of the failure, definite conclusions on this point were not reached. There were, however, several factors which may have contributed to the failure, these being:

1 Formation of analcite scale or other scales of this group, which have not been adequately identified.

2 Concentrated heat input at certain sections of the tube, due to cracking off of external scale which accumulated on the outside of the tube.

3 The presence of oil or grease brought into the feedwater from the lubrication of the feedwater pumps.

In order to study factor (1) further, additional X-ray analyses were made of the deposits.

In factor (2), it was recommended that the evaporation tests be repeated and the furnace temperature so regulated that the average heat input would be in the vicinity of 50,000 Btu per sq ft per hr. The evaporation tests, leading to the failure of the tube, had been made at an average heat input of 100,000 Btu. It was calculated that, with this average heat input, the lower half of the tube where failure occurred was subject to a heat absorption of 150,000 Btu and the upper half of the tube to 65,000 Btu.

This compares with a maximum and average heat input of the plant boiler of 50,000 and 25,000 Btu per sq ft per hr, respectively. During the week of August 5, the Deepwater contract was authorized and the boiler to be installed at Deepwater was purchased. This boiler was designed for a maximum and average heat input, respectively, as previously mentioned.

The recommendations for repeating the test run follow:

The proposed test run would be for 30 days, after which one tube would be removed and sectioned for examination. The second tube in the furnace would not be disturbed but the boiler would be put back on the line and continued in service to determine if scale would accumulate under the operating conditions proposed, after the second 30-day period of service.

The decision to increase or decrease the rate of heat input on the tubes, during the second 30-day run, would be determined after the first tube was cut and examined.

In order to eliminate as far as possible the presence of oil or grease in the feedwater from lubrication of the boiler feed pump, a metallic packing with a graphite base, which would not require the use of oil or grease, would be used.

BOILER OPERATION

The boiler was placed in operation October 18, and the furnace temperature so regulated that the average heat input was in the vicinity of 50,000 Btu per sq ft per hr.

The schedule of testing the water during the various steps in treatment was the same as previously discussed. The weekly summary of the tests on the water-treating system is part of Table 7. Data on the furnace and evaporating conditions on this run are given in Table 6.

No abnormal operating difficulties were experienced for the 30-day period, October 18 to November 17, the boiler being shut down on this last-mentioned date.

The south tube was removed and sectioned for examination. No blisters were noted along the wall of the tube and the internal deposit was of quite different appearance from that noted after the 60-day run. The deposit on the tube formed during the 30-day run was easily removed and had the appearance of sludge rather than showing any crystalline formation.

Illustrations of the straight section of the tube and a close-up view of the top portion before removing the internal deposits are shown in Figs. 18 and 19.

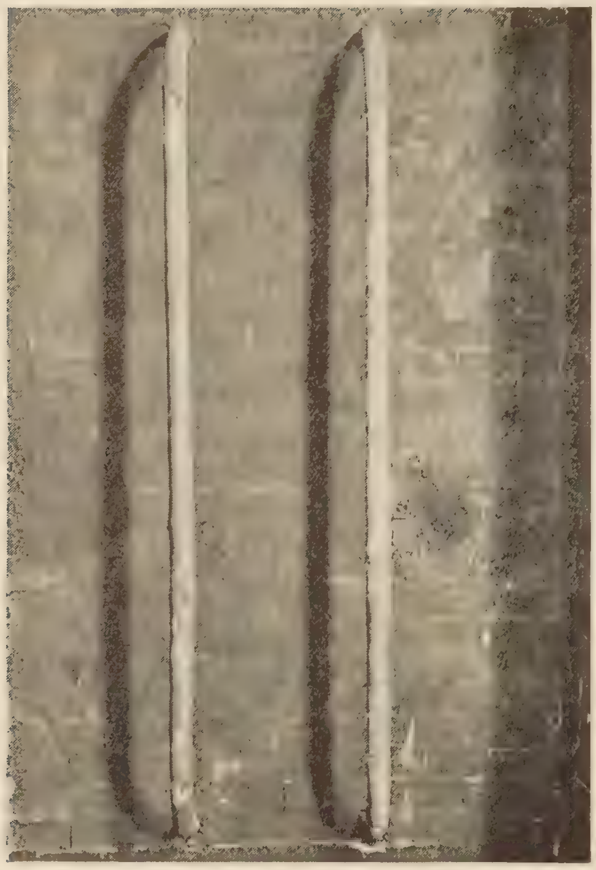

Fig. 12 Showing Boiler Tubes After 60-Day Run
(Dark spot on right-hand side of photograph caused by steam impinging on brickwork from failure north tube.)

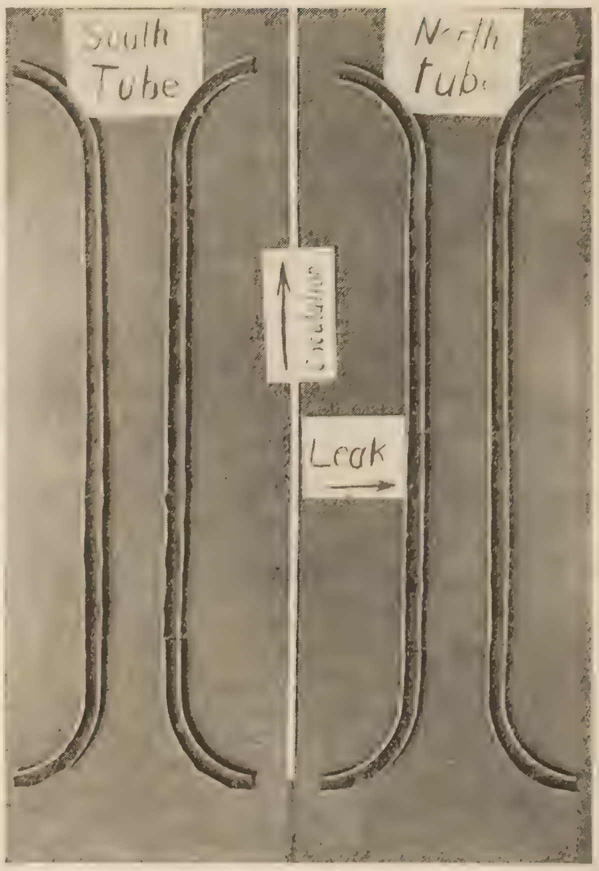

Fig. 13 Sectioned North and South Boiler Tubes After 60-Day Run

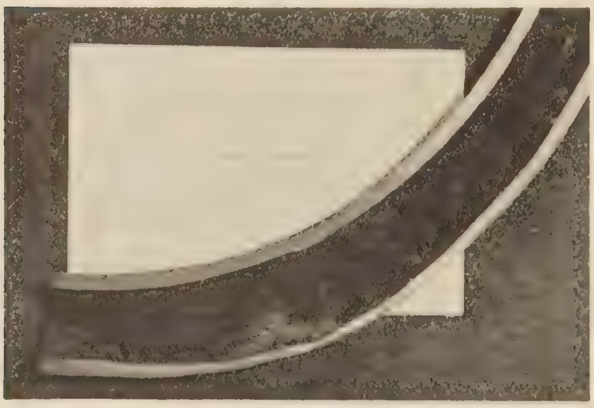

Fig. 14 Sectioned Lower Bend—North Tube After 60-Day Run

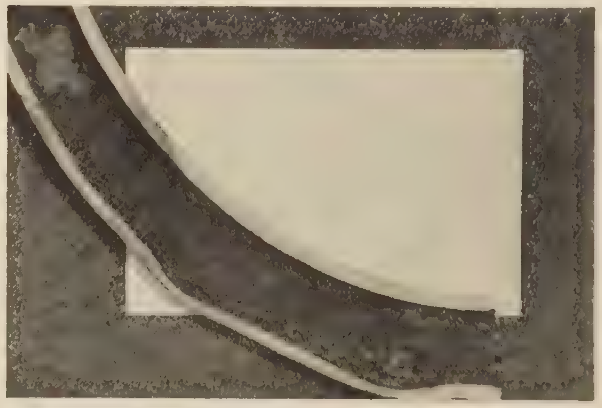

Fig. 15 Sectioned Lower Bend—South Tube After 60-Day Run

The internal-surface deposit was divided into two portions, namely, from the upper half and lower half. The chemical analysis of each portion is given in Table 8, samples Nos. 6 and 7. Microscopic examination of the tube metal was also made.

The zinc oxide, showing in the chemical analysis, resulted from contamination of the feedwater with zinc from a galvanized line between the softener and deaerating heater. This source of contamination was eliminated on the succeeding run.

Third Boiler Run—Second 30-Day Run

The south tube was replaced with a new tube and boiler operation was again resumed on November 22. Due to the satisfactory internal condition of the south tube after the first 30-day run it was decided to increase the rate of heat absorption to 75,000 Btu per sq ft per hr during the second 30-day run. With this average heat input it was estimated that the maximum and minimum heat input would be 110,000 and 50,000 Btu per sq ft per hr, respectively.

Fig. 16 Section of North Tube Showing Internal Location of Failure After 60-Day Run

Fig. 17 Section of North Tube Showing External Location of Failure After 60-Day Run

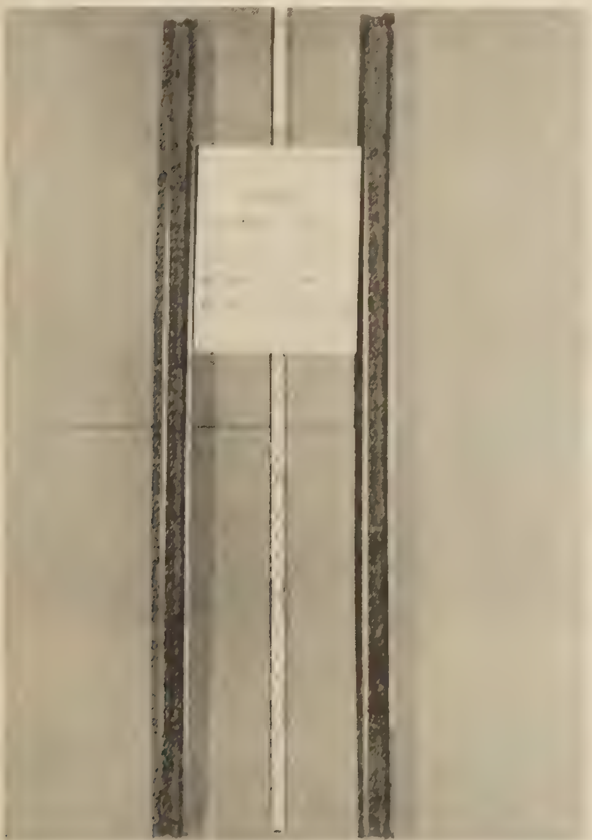

Fig. 18 Straight Section of South Tube After First 30-Day Run

Fig. 19 Close-Up View of Top Portion of Tube in Fig. 18

During the operation of the first 30-day run it was noted that the boiler water from the continuous blowdown was quite clear, that is, free from suspended solids. This condition was further checked by the large accumulation of soft sludge in the bottom of the boiler header when opened after the run mentioned.

The continuous-blowdown line was connected to the bottom of the header and, from the appearance of the internal deposit in the south tube after the 30-day run, it was the opinion that adequate removal of sludge was not being obtained. The sludge probably accumulated ahead of the continuous-blowdown control valve and acted as a filter in preventing further sludge removal.

To overcome this condition in the second 30-day run arrangements were made to open the continuous-blowdown valve wide every 8 hr and rapidly blow down from 4 to 5 lb of water from the boiler. This volume of water was weighed, together with the normal continuous blowdown, in arriving at the total blowdown from the boiler.

The effectiveness of this intermittent blow may be noted from

the data in Table 9. Samples of boiler water were collected before, during, and after the intermittent blow.

The time interval between collecting the sample marked "during intermittent blow" and "after intermittent blow" was approximately 2 hours. It required that length of time to reset properly the continuous-blowdown control valve.

(Tube was exposed during first and second 30-day run.)

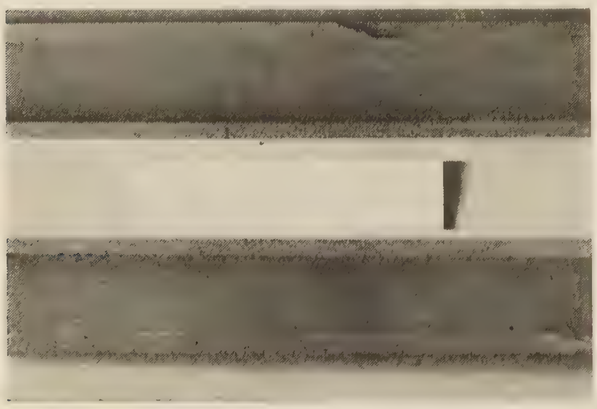

Fig. 21 Close-Up View of South Tube as Shown in Fig. 20

Fig. 23 Typical Straight Section of Tube in Fig. 22

Table 9 shows the effectiveness of removing the suspended solids by intermittent blow. As a check on the suspended solids, the suspended iron in each water sample was determined and reported in Table 9. Very little change was noted in the sodium-chloride content which indicated that not sufficient water was removed during the intermittent blow to affect the total dissolved-solids concentration.

TABLE 9 EFFECT OF INTERMITTENT BLOWDOWN IN REDUCING SUSPENDED SOLIDS

Blowdown	Date	Suspended solids, ppm	Suspended iron as Fe	Sodium chloride ppm
Before intermittent blow....	12/6/40	13.4	..	93.8
During intermittent blow....	12/6/40	251.4	..	99.7

The same procedure of testing, supplementary treatment, and furnace observations was followed as discussed under the first 30-day run. The data on the feedwater treatment and boiler-water test are part of Table 7, and on the furnace and evaporating conditions are part of Table 6.

The second 30-day run terminated on December 22 when the boiler was shut down.

Both tubes were removed and sectioned for examination. Figs. 20 and 21 show the south tube, and Figs. 22 and 23, the north tube, before any internal deposits were removed. A comparison of Figs. 20 and 21 with Figs. 18 and 19 will indicate the difference in quantity of sludge. Very little if any sludge accumulation showed in the south tube after 30 days of operation at 75,000-Btu heat input, as compared with 30 days of operation at 50,000-Btu heat input. The only major difference other than the heat input was the intermittent blow to remove suspended solids.

The north tube, which had been exposed for both 30-day runs, showed less sludge accumulation than was present in the south tube exposed for the first 30-day run. This likewise indicated that the intermittent blow not only prevented sludge from accumulating but also assisted in removing old sludge previously deposited.

The chemical analyses from the south and north tubes are given in Table 8 for samples Nos. 8 and 9.

The zinc content of the sludge from the south tube, after the second 30-day run, was 1.94 per cent as ZnO, compared to 12.1 per cent after the first 30-day run. The decrease of zinc in the sludge was due to a change in the feedwater piping, that is, from galvanized pipe to stainless steel. Complete elimination of zinc is quite problematical as the raw water contains varying amounts which are not entirely removed by the feedwater treatment.

Conclusions

1 The investigation showed that the Dye Works water supply can be treated so as to obtain a supply of suitable purity for high-pressure boiler-feed requirements. It was possible to remove the color and reduce the silica content to 2 ppm or lower, by suitable iron-salt coagulants.

2 During the operation of the zeolite softener for removal of hardness in the filtered water, it was found necessary to change the standards as to softener operation to obtain desirable low hardness at all times for boiler feed. This observation was of sufficient importance that special tests were made by the softener manufacturer, and the specifications and guarantees on softener capacities were completely revised. This represented a distinct change in the feed treatment which was directly applicable to the plant-size softening equipment, as a result of the experimental work.

3 The heat input on the experimental boiler was at a maximum of 150,000 Btu with an average of 100,000 Btu when the tubes failed. When lowering the average to 75,000 Btu, which represented a maximum of 110,000 Btu, no trouble with scale formation was experienced. This heat input considerably exceeded the maximum of 50,000 Btu, the expected operating condition on the plant unit. With more favorable water-treating conditions, as would be expected on a plant scale, there is every reason to believe that the plant unit can be operated for at least 6 months between inspections without forced outage.

4 The practice of intermittent blowdown for sludge removal on the experimental boiler has been directly applicable to a similar location of intermittent blow on the plant boiler. Without this information, it may be quite definitely stated that, the boiler manufacturer would not have agreed to intermittent blow from the lower drum on the plant unit. Engineers of the manufacturer have always been of the opinion, even at boiler pressures below 1400 lb, that intermittent blowdown from the lower drum was not necessary and advised against such procedure.

5 The experience on silica removal and operation of the experimental boiler, at heat-absorption values well above the maximum expected in the plant unit, show that considerable knowledge and confidence have been gained which will assist in avoiding forced outages and maintenance on the plant unit.

Discussion

S. B. Applebaum.[2] The work described in this paper represents a pioneer effort and a major advance in the field of feedwater treatment for high-pressure boilers.

Previous practice in this country for boilers having a pressure as high as 1400 psi has been more or less confined to a low percentage of make-up as in central power plants. All of these plants used evaporators to distill even that small percentage of make-up. There is only one other plant now in operation that approaches this boiler pressure which uses Zeo-Karb feedwater treatment instead of evaporators, and that is the Consolidated Edison Company, Waterside Station, New York, N. Y., but in that case the raw water comes from the New York City supply and is therefore of much superior quality as compared to the natural pond water involved in the Deepwater case. Furthermore, only 25 per cent make-up is involved at Waterside, whereas, the make-up at Deepwater will be 100 per cent.

It was due to the fact that no actual operating experience in this country was available on chemical feedwater treatment for 100 per cent make-up to boilers of such high pressure that this extensive experimental work was undertaken.

The successful development of high-pressure boilers has been more or less dependent upon equally successful development of improved feedwater-conditioning methods to permit such high-pressure boilers to function successfully with chemically treated feedwater. The du Pont Company is rendering a service to the engineering public in publishing the interesting data obtained in these tests, which should be of considerable help to the designers of future high-pressure plants.

The investigation brings out a point of increasing importance, i.e., that boiler design and the type of feedwater treatment to be selected must be considered simultaneously. In other words, the boiler designer, in order to insure successful operating re-

[2] Vice-President, The Permutit Company, New York, N. Y. Mem. A.S.M.E.

sults, must become more and more cognizant of the chemical composition of the feedwater and the effect of the various possible constituents of this feedwater on boiler operation. Likewise, the specialist in feedwater treatment must take into consideration boiler design before recommending any specific type of feedwater treatment for successful operating results with any particular boiler.

The raw water in this case will come from a pond or reservoir behind Munson Dam. It is a typical surface supply, such as is frequently encountered on the eastern seaboard and will be subjected to the usual contamination of color, organic matter, algae, turbidity, etc. It also has a rather high silica content, ranging from 8 ppm up to 25 ppm, or an average of about 14 ppm. Table 10, of this discussion, gives the average composition and maximum composition to be expected.

The chemical constituents which cause the major operating difficulties in high-pressure boilers are (1) hardness, (2) silica, (3) color and organic matter, (4) alkalinity, (5) oxygen.

The first two impurities, hardness and silica, are mainly responsible for the objectionable scale deposits in the boiler, as well as deposits in superheaters and turbines, which may result from carry-over. The third and fourth impurities, color and alkalinity, are mainly responsible for carry-over difficulties. The fifth impurity, oxygen, is mainly responsible for corrosion.

Therefore, the feedwater-treatment plant that was outlined in a preliminary manner to condition this surface water to make it suitable for feeding these high-pressure boilers involved:

1 Color removal to take care of the physical impurities mentioned.
2 Silica removal.
3 Hardness and alkalinity removal.
4 Deaeration to remove oxygen.

Our preliminary laboratory experiments also indicated that it would be difficult to accomplish the removal of the color and the silica simultaneously, because the peculiar nature of the color in this case made it necessary to coagulate at a pH of 4.5 to 5 to insure very good color removal. The silica removal, on the other hand, required an optimum pH of about 9 to 9.5. Some silica is removed in the color-removal step, as indicated in the author's Table 2, but the major silica removal is accomplished in step No. 2 at the higher pH values. Permutit Spaulding precipitators were used for both color removal and silica removal in the two stages mentioned because, in this design of reaction tank, the sludge, formed by the chemical reagents added, is kept suspended by the agitators in the bottom of these tanks and the sludge is accumulated to occupy most of the lower portion of the tank. This large amount of suspended sludge in the precipitators is especially advantageous for adsorption phenomena, such as color removal and silica removal. Furthermore, the large excess of sludge present tends to drive both the color and the silica down to lower values than could be obtained in the absence of sludge. Therefore, an economy of chemical reagent and consequent lower operating cost is realized, as well as a superior quality of effluent.

The filters following the precipitators use nonsiliceous filtering medium, such as Anthrafilt, to avoid pickup of silica during filtration. Similarly, in the case of zeolite water softeners, a nonsiliceous zeolite, "Zeo-Karb Na," is employed to avoid pickup of silica from the zeolite. In the paper, Table 2 gives the analysis of the water at each step of treatment and below Table 2 is given the treatment costs per million gallons. This was based on the first part of the experimental work where Zeo-Karb H for cation removal and De-acidite for anion removal were used in the experimental units. Later, when the experimental boiler was installed, the Zeo-Karb H and De-acidite were no longer employed, and instead, Zeo-Karb Na for hardness removal alone was utilized and no anions were removed. Table 11, of this discussion, shows the average results at each stage of treatment, which are anticipated for the large plant now being designed and constructed. At the bottom of Table 11, are given the chemical costs anticipated.

(Note: The chemical costs are based upon present market prices, and may be subject to some fluctuations by the time the plant starts operation in 1942.)

As the author points out, the results anticipated in the large-scale plant will be superior to the results obtained in the pilot plant because of the greater ease of control and the greater depth of sludge, etc., in the large tanks.

The actual plant will also involve some changes from the experimental treatment, such as:

1 Acid will be added in addition to ferric sulphate for color removal. The acid feed will be pH-controlled and will save some ferric sulphate, thus reducing the chemical costs for this step.

2 Aeration will be employed after the color removal and before the silica removal, so as to reduce the free carbon dioxide in solution below 10 ppm. This will save an equivalent amount of

lime in the silica-removal step and will reduce the total hardness in the effluent of that step, which the sodium zeolite will have to remove, thus keeping the operating costs at a minimum.

It is to be noted in Table 11 that the anticipated hardness of the zeolite effluent will be under 2 ppm, and most of the time the hardness will be under 1 ppm. This will reduce the amount of phosphate employed for secondary treatment, added directly to the boilers, and will therefore reduce the amount of phosphate sludge that will be formed in the boiler. This very low hardness in the zeolite effluent is obtained by special attention to the design of the softeners and to their regeneration. Also, special soap tests are employed to test the zeolite effluent in order to make sure that the hardness does not exceed the low figures mentioned.

Our large-scale water-treatment plant is being designed in co-operation with the American Gas & Electric Company and the du Pont Company, and is expected to go into operation early in 1942. We all look forward to publication of the actual operating results obtained next year.

F. G. Ely.[3] The author is to be congratulated for the thoroughgoing manner in which he has undertaken and prosecuted this unique and interesting experiment in feedwater treatment. Means for obtaining the final proof of results, under pilot-plant conditions of evaporation which simulate, but in many respects exceed, those of plant operation, were necessarily elaborate and expensive, and the Society is indebted to the author and his company for this comprehensive record of their experience and data.

During the course of the steaming tests, certain observations were made of heat-transfer and circulation characteristics of the boiler system, as given in Table 6 of the paper. It will be of interest to note that, at the present time, the writer's company is conducting a short supplementary series of tests to extend these data beyond the range of temperature and rating which could be accommodated in the principal series of feedwater experiments. Condensate is being used in the system, and additional data are being taken with high-velocity thermocouple and thermal probe to explore the distribution of temperature and heat absorption in the vertical gas passage where the boiler tubes are located.

Incomplete and preliminary results indicate that the estimated values of maximum and minimum absorption rate, as stated by the author, are reasonably confirmed; also that, where no difficulty with internal cleanliness of the tubes is involved, the evaporating surfaces of this model boiler have withstood materially higher rates of heat transfer without distress.

It is perhaps significant to note that the maximum absorption rate sustained in the author's final 30-day run exceeds the minimum and average rates of the first 60-day run when overheating of the tube metal throughout its length was detected. This would seem to indicate that causes 1 and 3, in conjunction with the sludge condition, are primarily accountable for failure of the tubes in the initial run. Beyond doubt, however, any question of internal cleanliness is aggravated by high rates of heat absorption.

Fig. 11, of the paper, illustrates an arrangement of high-pressure manometers which were used in obtaining data on circulation flow. In this simple circulating system, the total downward flow of water in the header was passed through a concentric orifice, and differential pressure was indicated by a column of carbon tetrachloride, submerged by water in the connecting lines. In calculating the rate of flow entering the boiler tubes, as given in Table 6, of the paper, manometer readings were first corrected for fluid-density differences of the carbon tetrachloride, the cool water in the connecting piping, and the hot water, at saturation temperature, in the header. The separately measured blowdown rate was then subtracted from the total flow to obtain the net flow rate entering the tubes. From these data, and the accompanying values of latent heat and absorption rate, it was possible to calculate terminal ratios of water to steam in the mixture leaving the tubes, as given in Table 6, and also the corresponding flow velocities.

These measurements were undertaken for general confirmation of conditions existing during the feedwater experiments, and are not regarded as precision tests of circulation fundamentals. It is of interest, however, to add that the observed results are in good agreement with previously calculated characteristics of the system.

The second manometer, shown at the left in Fig. 11, of the paper, served primarily as an auxiliary indicator of boiler-water level.

The author has indicated that, in the design of the plant boiler, much lower average and maximum heat-absorption rates are to be expected. This is an important consideration for an operating unit that is to be supplied with high percentage make-up of treated water, and lends an added factor of safety against unexpected or inadvertent changes in the treating plant. It is reassuring to have obtained such tangible evidence of successful water treatment under accelerated conditions in the experimental unit.

E. B. Powell.[4] The author records for us another step in the utilization of chemically conditioned natural waters for the generation of steam at high pressures and under high rates of heat absorption. As in most fruitful experimental studies, the perfect attainment is not reached on the first attempt, and the difficulties encountered are accepted as mere warnings of avoidable hazards. In his summation of opinions, secured on the tube failure after the 60-day run, the author states that no definite conclusion was reached as to the cause. The inclusion of quantity values for the deposits removed from the different tubes following the 60-day run and the two succeeding 30-day runs would doubtless now make the cause of the failure somewhat clearer. However, the evidence which is presented would seem to leave little room for doubt that the essential cause of the tube over-heating had been excessive quantity and insufficient fluidity on the part of the sludge content of the boiler water. In fact, the conduct of the subsequent test runs would indicate that the author himself suspected sludge to be the cause of the difficulty.

Although primarily devoted to a discussion of those aspects of the experimental study on which the commercial treatment of feedwater for the Dye Works' boiler-plant extension was to be based, the paper includes numerous other data of much interest and value at this time. Such items which are especially noteworthy are the results of the water treatment during part 1 of the experimental program, as given in Table 2, of the paper, and the furnace-performance and boiler-circulation data of Tables 5 and 6, with Figs. 10 and 11. Full demineralizing of natural waters has yet to attain the truly commercial stage but, meanwhile, demonstrations of performance on different waters are genuine contributions to knowledge. There is also a serious deficiency of data on gas and brickwork temperatures under different furnace and combustion conditions and on rates of circulation under different conditions of heat absorption and shape and dimensions of path. The author's observations help fill in the gaps.

[3] Analytical Engineer, The Babcock & Wilcox Company, New York, N. Y.

[4] Consulting Engineer, Stone & Webster Engineering Corporation, Boston, Mass. Mem. A.S.M.E.

S. E. Tray.[5] The author is to be congratulated for the comprehensive information which he has developed from the test data obtained in this experimental project. This is perhaps the first time that such a complete series of tests has been made on other than a laboratory scale, prior to actual plant installation. The fact that all possible factors were taken into consideration, in order to simulate actual plant operation, makes the results of paramount importance to those contemplating the installation of high-pressure boilers with a high percentage of make-up.

Of particular interest are the results recorded at heat-transfer rates as high as 100,000 Btu per sq ft per hr. This is somewhat in excess of current design practice, but experience has indicated that such conditions may be reached on individual tubes at localized points in the boiler. Even at these high rates of heat transfer, there was no apparent distress noted on the heating surfaces of the boiler. This is an indication that, with the water in the proper condition to prevent deposits, no fear need be felt in operating at high rates of heat transfer as long as the heating surfaces are constantly supplied with water. While this experimental project has demonstrated the effectiveness of proper water treatment in a high-pressure test boiler, there may be some question as to whether a full-size boiler will have equally sufficient circulation. The results recorded by the author should encourage further investigation by boiler manufacturers to insure proper and adequate circulation at all ratings on full-size boilers.

The use of the X-ray diffraction method in studying the boiler deposits has proved of considerable value. This method not only provides a positive method of identification for the various constituents in the boiler deposits, but also indicates the manner in which formation occurs on the heating surfaces. All of the deposits contained an appreciable percentage of iron, which would render optical methods useless as a means of identifying the various combinations present. The use of the X ray in the study of boiler scales, while rather recent, has already pointed the way toward acquiring a more complete understanding of the methods of scale formation. This will be extremely valuable in suggesting definite means of preventing such deposits. As an illustration of the effectiveness of X-ray analysis, some five different types of silica scales have been identified. All of these were formed under widely varied conditions, and could not be differentiated by the usual chemical analysis.

[5] Allis-Chalmers Mfg. Co., Milwaukee, Wis.

The effect of external removal of silica from the feedwater is evidenced by the lack of any silica-scale formation in the deposits in the boiler. While silica is not completely absent in the feedwater, it has been reduced to a practical minimum. The question as to how low the silica should be carried in high-pressure boilers is as yet unanswered, but it is obvious that it should be as low as may be obtained, consistent with operating costs and capital investment. It is also obvious that water treatment should provide for a minimum of alkalinity and dissolved solids, if we are to operate boilers at 1400 psi or higher with large percentages of make-up water.

From the standpoint of boiler operation, this experimental project has been very informative, and has indicated that similar operation on a commercial scale is entirely feasible. Such plants will, of necessity, operate back-pressure turbines or topping units, in which the maximum kilowatt output must be obtained in order to justify the investment. In view of the influence of boiler water on steam conditions to high-pressure turbines, it will be interesting to observe the results obtained in actual plant operation. It is hardly feasible to construct a small turbine to operate in conjunction with a test boiler such as the author has described. Consequently, until actual operating data are available, the turbine characteristics for such a plant will not be known. It is reasonable to suppose, however, that, after all the factors have been considered which relate to proper steam conditions for high-pressure turbines, there should be a minimum of difficulty from this angle. Nevertheless, it should be recognized that reliable and continued operation of turbines, installed with boilers of the type under discussion, is absolutely essential. In this connection, the operating experience of 1400-lb turbines, operating in low-make-up plants, will be extremely valuable.

Author's Closure

Further data on the chemical cost of treating water indicate that the cost will be approximately $61 per million gallons. This cost is based on later market prices of chemicals than those given in Table 11.

A Study of Damper Characteristics

By P. S. Dickey[1] and H. L. Coplen,[2] Cleveland, Ohio

But meager information is at present available covering the design of dampers in spite of their universal use in furnace control. Tests made by the authors have shown that the size of the damper for a given application is the most important factor in determining the flow characteristic. A simplified procedure for predicting the flow characteristic of commonly used types of dampers is offered to stimulate interest in this subject among designing engineers. Mechanical features of design are discussed and suggestions for improvement offered. The relative merits of different types of dampers are considered.

Regulating Characteristics of Dampers

In spite of the universal use of dampers as a means of controlling air and gas flow for furnaces of all types, there are but few published data covering the design of these devices. In boiler practice, prior to the introduction of mechanical-draft fans, the primary consideration in damper design was to avoid any pressure loss and thus reduction in capacity when the damper was wide open. To achieve this end, the dampers were usually made quite large, and the tendency has been to follow this practice without any thought as to their regulating characteristic.

A point which undoubtedly needs clarification is that of the meaning of a desirable flow characteristic in dampers. When the damper is used in combustion furnaces for regulating the air-fuel relation or for regulating the furnace pressure, it is desirable that the change in rate of gas flow per increment change in opening of the damper be reasonably uniform from the tightly closed position to the wide-open position. It is hardly possible to achieve this desirable result in dampers of conventional design but, with proper consideration of the size and general form of the damper, a reasonable approximation may be obtained.

It is not uncommon to find dampers installed which cause a change in the rate of gas flow 10 times as great per deg travel at 10 deg opening as is caused at 60 or 70 deg opening. This is bad for manual control since the operator cannot coordinate the effect and the cause and, hence, finds it difficult to obtain proper regulation. It is bad for automatic regulation as the regulator cannot be properly stabilized for the sensitive portion of the damper and yet achieve the maximum effective speed at the insensitive portion of the damper.

Since dampers are usually of considerable size, it is not ordinarily practicable to build them as precise mechanisms but, as will be pointed out later, this is entirely unnecessary. Dampers of simple and inexpensive construction and with quite reasonable clearances can be built to give good regulating characteristics for manual or automatic control if a few fundamental considerations are followed.

Mechanical Design

In selecting the most suitable damper design for a specific application, the designer must consider the following factors:

1 Is the damper to be used for regulating purposes or for complete shutoff only?

2 Is the duct in which the damper is located handling hot or cold gases?

3 Is the duct handling gases under pressure or under vacuum?

4 What size damper should be used?

5 Should the damper frame be round or rectangular?

6 Should single- or multiple-blade dampers be used?

7 What provisions shall be made for mechanical and dynamic balance?

8 What type of external linkage should be used for operating the damper?

If a damper is to be used for shutoff service only, the two prime considerations are the leakage possibilities and the power required to operate it. If the damper is to be used for regulating service, the leakage may or may not be important, depending upon how much range must be covered. The power required for operation is equally as important with the regulating damper as with the one used for shutoff only. The flow characteristic of the regulating damper must be considered if proper results are to be obtained.

Dampers of conventional design are suitable for use in ducts where gas temperatures do not exceed 800 F. They may also be used at higher temperatures if suitable allowance is made for the decreasing strength of materials at the elevated temperatures. For temperatures in excess of 1200 F, the usual practice is to use gates built of refractory materials which operate in water-cooled slides.

In general, the clearance between the damper blades and the damper frame must be increased as the gas temperature increases, due to possible warpage of the ductwork and damper frame at the elevated temperatures. The tests, made and described later, on typical types of dampers were carried out with models having close clearance and large clearance so that the effect on the flow characteristic may be determined. For ordinary work, the damper, having side and end clearances of 0.25 per cent of the cross-sectional dimensions of the frame, has been chosen as the design which will give good results without excessive manufacturing cost. For higher-temperature service, a design, having a side and end clearance of 2 per cent of the cross-sectional dimensions of the frame, has been chosen. It is believed that this added clearance will take care of any changes in the shape of the damper frame due to temperature variations.

Proper design of the damper shafts, shaft bearings, and seals is of utmost importance, particularly where the dampers are located in ducts in which the gases are under pressure and at high temperature and where there is any dust present in the flue gas. Both the sleeve type and ball-bearing type have been used with good success, though it is important that either type of bearing be located outside the damper frame and spaced some distance away from it with a suitable seal at the point where the damper shaft extends through the frame. Most bearing troubles are due either to misalignment or to hot gas or dust-laden gas being blown into the bearing through the opening between the damper shaft and damper frame.

In the smaller-size dampers, with rectangular or round frames, it is usually possible to provide frames of good rigidity, therefore, clearances may be small and leakage kept to very low values. A single-leaf damper, closing at right angles to the side wall, is the design which gives the best flow characteristic. There is no great

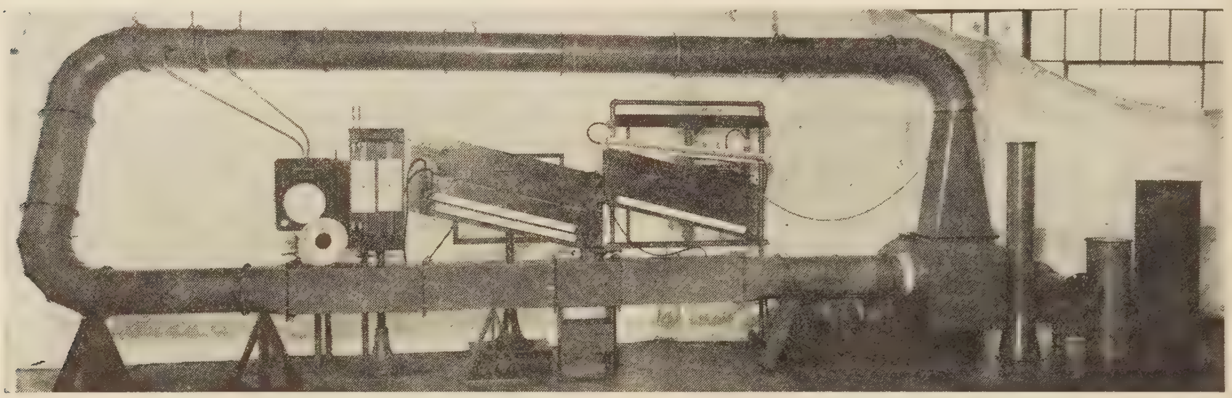

Fig. 2 View of Test Plant

difference between the area or flow characteristic of single-leaf dampers in rectangular or round ducts. Therefore, there is no reason for changing the shape of the duct at the point where the damper is installed until the duct size becomes large enough so that multiple-blade dampers are required.

In the larger sizes, where it is not practical to retain the single-leaf construction, in view of the large values of torque obtained due to small unbalance of the blade area, it becomes necessary to divide the damper into a number of blades or louvers. To accomplish the desirable flow characteristic of the single-leaf damper, a partition can be installed between blades. The use of this dividing partition not only gives the most desirable area and flow characteristic, but also provides a means of changing the over-all effective area of the damper after it is installed. In other words, if the damper is oversized it is possible after installation to block one or more of the louvers in the closed position and use only the remaining louvers for regulation.

Dividing partitions should be approximately the same length as the blade width to give proper results. The damper blade should be arranged to close at right angles to the dividing partitions as in the case of the single-leaf damper described. To overcome the increased leakage in the damper with the dividing partitions, which results because the blades cannot be closed against one another, side stops may be installed on the duct and on the dividing partition without seriously affecting the flow characteristic.

Another way in which to accomplish the flow characteristic of the single-leaf damper with multiple-louver dampers is to arrange the external linkage so that adjacent blades rotate in opposite directions. The principal difficulty with this arrangement, however, is that it is difficult to close the openings tightly between the louvers, unless sealing strips are installed between blades.

There is no reliable rule for determining the proper number of louvers for a given-size damper. It becomes necessary, therefore, for the designer, in a given-size frame, to select the number of blades which will keep the width of each blade, and thus the pos-

sible unbalanced force, within the limits of the driving mechanism. At the same time, he must keep the number of blades and thus the possible leakage area as low as possible.

Efforts have been made from time to time to obtain perfectly balanced dampers by adjusting the effective area of the blade on either side of the supporting or operating shaft. Such efforts are entirely justified as a means of reducing the torque necessary for operation, but this is strictly a field job as it is impractical for the designer to attempt to make a provision of this nature. In most cases, force unbalance is caused by area unbalance or by some unpredictable stratification of the gas flow in the duct. In dampers having louvers of considerable size, particularly width, an unbalanced area, caused by variations in manufacture well within the tolerance for this type of equipment, may result in considerable force being exerted on the operating shaft.

No doubt there is some unbalance exerted by the variable pressures existing over the area of the blade on the downstream side, but this likewise is difficult to predict, in view of the lack of standardization of damper types and sizes. Therefore, the best procedure for the designer is to strive for equal distribution at the areas of the damper blades and, if necessary, provide a balancing pendulum of suitable size on the outside of the duct, which may be used to offset any undesirable unbalance or to produce an unbalance in the opening or closing direction for those applications where this feature is desired.

When the desired flow characteristic cannot be obtained by using a proper size of damper as described later in the paper, approximate results may be obtained by the use of angularity in the driving linkage. For example, if an operating linkage is provided, as shown in Fig. 1, and the driving crank A starts close to the dead-center position when the damper is closed, a motion characteristic is obtained which provides only $^1/_5$ of the travel of the damper per deg motion of the driving crank at 10 deg that it does at 80 deg open. This motion characteristic is shown in Fig. 1, and it will be noted that the motion characteristic compensates for the poor flow characteristic of the oversize damper, which is usually similar to that also shown in the illustration. However, when using a linkage of this type to overcome a poor flow characteristic, it is essential that all bearings and all pins in the linkage be free of backlash or of lost motion, as otherwise all benefit of the retarded damper action near the closed position will be lost.

Investigation of Flow Characteristics

The misapprehension which too often exists among designers and users of dampers is that, because a specific damper has given good results in one application, it will likewise give good results in all applications. Efforts have frequently been made to standardize damper design and size for definite capacities, but the results are not always satisfactory for reasons which become obvious when further study is made of the problem.

For the purpose of the studies described later in the paper, the plant, illustrated in Fig. 2, was constructed. It was felt that models 12 in. square or of equivalent area would give reliable results and a blower was provided which would give velocities up to 5000 fpm, which is as high as ordinarily encountered in furnace work.

Twelve different damper types were tested and, of these twelve, nine have been selected as representative types. The characteristic curves and design details are included in Fig. 4 and Figs. 8 to 15. Of these Figs. 8 to 15 are grouped later in the paper for ready reference. During the tests, measurement of air flow was by means of an orifice-type Bailey Gas Meter, type CG35, and measurement of pressure losses was made by means of specially built inclined manometers.

The beginning of real progress in this investigation came with the realization of two factors of extreme importance in damper design:

1 The gas velocity through a given damper has no material effect on the flow characteristic if the total resistance of the system exclusive of the damper is unchanged.

2 The flow characteristic of a given damper is variable and is determined primarily by the ratio of its resistance at any given opening to the resistance of the system in which it is installed.

For example, in the system shown in Fig. 3, which consists of a fan drawing gas from a point of fixed pressure through a resistance, such as heat-transfer surface, when a damper of a definite size is installed in the system as at A, its flow characteristic is fixed. Changing the volume of gas or, in other words, the velocity through the system does not affect the flow characteristic in any way. At each damper setting the percentage of the maximum flow at a given fan speed is essentially constant. This is illustrated by curve A in Fig. 3, showing a series of tests on the fan-and-duct system used in these tests.

However, if the fixed resistance of the system is changed, or if an additional resistance is added to the system, as may be done with the gate at B in Fig. 3, the flow characteristic of the damper is changed even though the fan speed is adjusted to restore the maximum velocity through the duct to the original value. This new flow characteristic curve is illustrated by curve B in Fig. 3.

Now, if the new value of resistance, obtained by adding that of gate B to the original fixed system resistance, is not changed, the flow characteristic shown by curve B is fixed and will retain the same shape even though the velocity is adjusted, by changing the fan speed over the entire range.

The foregoing statements need to be qualified as they are dependent upon the use of a fan which has a flat pressure characteristic or, in other words, one which maintains a constant pressure at a given speed regardless of the capacity. Such a fan characteristic is seldom obtained but, since there is no occasion for precise determination of flow characteristic, the effects of the fan characteristic can be disregarded. The intent of this work is to provide means of predicting approximate flow characteristics of different types of dampers in typical applications. Since, ordinarily, the fan characteristic will not seriously change the damper characteristic and since the important thing is to get the right type and size of damper for a specific application, the complication of incorporating fan characteristic to obtain precise results is avoided.

From the curves in Fig. 3, it becomes obvious that a given size and type of damper in a specific system will have a fixed flow characteristic regardless of the maximum gas flow. Therefore, if means can be provided for calculating the resistance of different types of dampers and if the total resistance of the system in which the damper is installed is known in advance, the flow characteristic of a given damper in that application can be predicted.

Damper-Design Characteristic Curves

Information covering the various damper types was obtained and the following data plotted on the typical damper characteristic sheet, shown in Fig. 4, which covers the single-leaf damper:

1 Design features
2 Area characteristic
3 Combined approach factor and coefficient of discharge
4 Resistance ratio
5 Flow characteristic.

The principal features of design are shown in the sketch in the lower right-hand corner of Fig. 4. All factors which have an important bearing on the flow characteristic of the specific damper design are tabulated below the sketch.

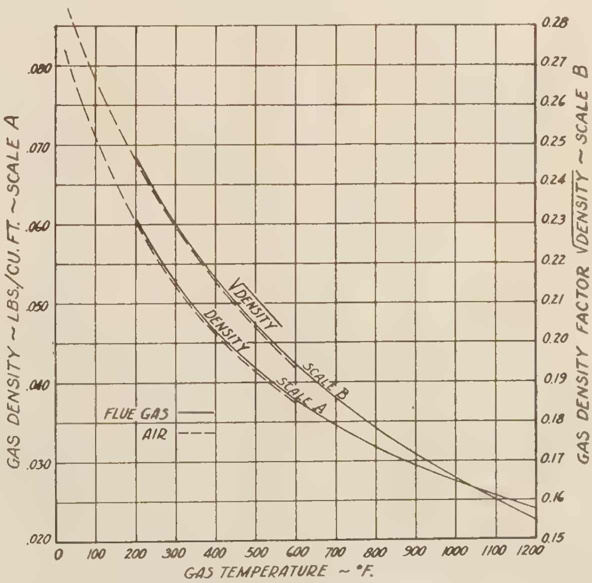

Fig. 7 Gas and Air Densities

The area characteristic of the specific damper type is shown in curve A in the lower left-hand corner of Fig. 4. This information was obtained as accurately as possible on the model tested but, obviously, will be affected somewhat by variations in the manufacture of a given type of damper.

The combined approach factor and coefficient of discharge was determined by calculation from the test data in accordance with the equation

$$C_f = \frac{W}{124.3\, A_2\sqrt{h_w}} \qquad [1]$$

where

C_f = combined approach factor and coefficient of discharge
W = pounds of air per hour at 80 F
A_2 = open area of damper, sq in.
h_w = damper differential, in. of water

This information is plotted as curve B in the lower left-hand corner of Fig. 4.

The resistance-ratio curves at the top of Fig. 4, and the flow characteristic curves in the center were obtained by actual tests of all the different damper types with readings taken at each 10-deg increment from the closed to the wide-open position. In addition, tests were made with thirteen different values of system resistance and these values were distributed as equally as possible between the lowest and the highest practical quantities.

Prediction of the Flow Characteristic

The prediction of the flow characteristic of the damper in a specific application is a relatively simple procedure with these data available. Knowing the maximum gas or air flow in cubic feet per hour, and the type and size of the damper to be used, the pressure loss across the damper may be obtained from the equation

$$h_w = \left(\frac{Q \times \sqrt{d}}{457.7 \times C_f \times A_2}\right)^2 \qquad [2]$$

where

h_w = damper pressure loss, in. of water
Q = gas flow, cfh
d = gas density at existing temperature, lb per cu ft (refer to Fig. 7)
A_2 = open area of damper at desired damper position, sq in.
C_f = combined approach factor and coefficient of discharge at desired damper position

Note: Obtain A_2 and C_f from damper characteristic curve for correct type. A_2 = per cent open area times open area of damper frame.

It will be noted that, in making this calculation, two different values are required from the damper characteristic curves covering the particular type being studied. Most accurate results are usually obtained by determining the pressure loss at damper openings from 20 to 40 deg. Therefore, a damper position should be selected between these values and, from the damper characteristic curves, the C_f value and the percentage of open area of the damper are obtained. Knowing the size of the damper, the maximum free opening can be determined and actual open area at the selected opening can then be calculated.

In furnace work, usually the system pressure loss at maximum gas flow is known and, in any case, it must be determined in order to predict the flow characteristic of the damper. It should be remembered that the system pressure loss means the total pressure loss from a point of constant pressure to the inlet of the fan or other draft-producing means. For example, a boiler furnace with forced- and induced-draft fans and a furnace-draft control consists of two complete systems. The forced-draft system consists of all ducts and heat-transfer surface from the forced-draft fan discharge to the furnace, which is the point of constant pressure. A calculation of the forced-draft damper characteristic must be made, using the air required for combustion and the resistance between the forced-draft fan discharge and the furnace. The induced-draft system includes all duct work and heat-transfer surface from the furnace to the uptake or induced-draft fan inlet. The flow characteristic of the induced-draft damper must be made on the basis of total gas volume and the pressure loss from the furnace to the uptake, or induced-draft fan inlet.

It may be found that, when a calculation is made on the basis of maximum gas flow and a damper opening of from 20 to 40 deg, the combined resistance of the damper plus the system is greater than the head available in the fan. This makes no difference, however, from the standpoint of determining the damper characteristic for, as pointed out previously, the damper flow characteristic is dependent entirely upon the ratio of its resistance at a given opening to that of the system. We can assume that a fan having a suitable static head is provided for the purpose of this determination. System pressure losses and damper pressure losses are determined with greater accuracy at the maximum gas flow and, since the form of the flow characteristic is not affected by the fan delivery, best results are obtained using these hypothetical values.

Knowing the system pressure loss and the damper pressure loss at a given opening, the relation between this damper loss and the combined damper-plus-system pressure loss is determined in per cent.

A point corresponding to this ratio or percentage at the specified damper opening is located on the resistance-ratio curves at the top of the damper-characteristic sheet. The particular one of the resistance-ratio curves, numbered from 1 to 13, which comes closest to intersecting this point, is selected and the flow-characteristic curve bearing the same number in the family of curves in the center of the damper-characteristic sheet is the correct one for that size and type of damper in the specific application. If the point located on the resistance-ratio curve comes between two curves, a reasonable approximation of the damper characteristic may be obtained by drawing a parallel curve correspondingly spaced between the two flow-characteristic curves in the center group which carry similar numbers.

The flow-characteristic curve, thus determined, gives the percentage of maximum gas flow at different damper openings and this may be converted to actual gas flow from the known maximum capacity. Likewise, if the capacity of the fan or other draft-producing medium is changed, these same percentage values will hold on the basis of the new maximum capacity; it is not necessary to make another flow-characteristic determination as outlined.

To assist in the determination of gas flow, curves and charts, showing approximate values of the air requirement and gas produced with combustion of various fuels, are included as Figs. 5, 6, and 7, and Table 1. In determining the gas volumes at the induced-draft damper, allowance should be made for increased gas flow due to infiltration.

Sample Solution of Damper Characteristics

Assume a steam boiler having a maximum capacity of 150,000 lb per hr at 400 lb pressure and 750 F, and a feed temperature of 200 F. Coal burned has a heating value of 13,500 Btu per lb. Boiler efficiency at maximum is 80 per cent with 140 per cent total air for combustion and 500 F gas-outlet temperature. Draft loss from furnace to induced-draft fan at maximum is 8.5 in. of water. Determine the flow characteristic of a four-leaf-louver induced-draft damper, 6 ft by 4.5 ft with no dividing plate, as shown in Fig. 13.

(a) From Fig. 5
Coal required = 16,000 (1.06 × 1.02) = 17,300 lb
(b) From Fig. 6
Pounds of gas per pound of coal = 15.4
(c) From Fig. 7
Gas density at 500 F = 0.042
Square root of density = 0.205
(d) From Fig. 13, at 30-deg damper opening
Flow coefficient, C_f = 0.60
Area = 45 per cent
Actual area = 0.45 × 144 × 27 = 1750 sq in.
(e) From (a), (b), and (c)

$$\text{Gas flow} = 17{,}300 \times 15.4 \times \frac{1}{0.042} = 6{,}340{,}000 \text{ cfh}$$

(f) From Equation [2]

$$\text{Damper resistance} = h_w = \left(\frac{6{,}340{,}000 \times 0.205}{457.7 \times 0.6 \times 1750}\right)^2 = 7.33 \text{ in.}$$

(g) Total system resistance = 7.33 + 8.5 = 15.83 in. of water

(h) Damper resistance in per cent of total resistance $= \dfrac{7.36}{15.86} =$ 46.3

(i) From upper series of curves Fig. 13, locate 46.3 per cent on vertical resistance-ratio scale and project to intersection with vertical at 30-deg damper opening (see dotted lines). Locate nearest resistance-ratio curve. Flow-characteristic curve in center group which has the same number is the flow characteristic of the damper under the system conditions specified.

Discussion of Types Tested

Figs. 8 to 15 (pp. 144 to 151) show the design characteristics of the various types tested, in addition to Fig 4, appearing earlier. It is believed that most of the types in general use are covered. The conclusions reached regarding the relative merit of the various types are as follows:

1 The single-leaf damper in a round or rectangular duct is a thoroughly practical design and, if built with clearances not exceeding 0.25 per cent of the duct width as well as properly sized to the job so that its resistance at 30-deg opening is not less than 55 per cent of the total system resistance, a good flow characteristic is obtained. A damper of this size will have a low loss at the wide-open position. The characteristics of these dampers are shown in Figs. 4 and 8.

2 The addition of side stops to dampers of single-leaf construction, as shown in Fig. 10, decreases the leakage without materially affecting the flow characteristic, assuming that the damper is properly sized as outlined. If side stops are used and the damper is properly sized to the job, the side clearance may be increased from 0.25 per cent of the duct width to approximately 2 per cent, as shown in Fig. 11, without materially affecting the flow characteristic. However, if the damper is oversize for the job, the increased side clearance will have an adverse effect on the flow characteristic, as indicated by flow-characteristic curves 11, 12, and 13 in Fig. 11.

3 A streamlined damper blade, as shown in Fig. 9, reduces the pressure loss at the wide-open position slightly, but not enough to be of any great importance. The flow characteristic of this design is not materially different from the flat-blade louver, and either will give good results if properly sized. The particular model tested had somewhat greater clearance than other types investigated, since it was felt that this damper could not be held to the same manufacturing tolerances. The leakage at low rates is therefore correspondingly higher. Side stops on this type of damper would reduce this leakage without materially affecting the flow characteristic.

4 Multiple-leaf-louver dampers, of the types shown in Figs. 12 and 13, give good regulating characteristics although it is much easier to obtain a good regulating characteristic with the damper having dividing partitions between the louvers than with the type which does not have the dividing partition. To obtain an equivalent flow characteristic, the damper without the dividing partition must be appreciably smaller, which may in some cases result in increased draft loss in the wide-open position. The characteristics of the model with the dividing partition could be improved by the use of side stops, which would reduce the leakage in the closed position. If these side stops were added, the flow characteristics would be similar to those in Fig. 10.

Butterfly dampers having cast frames and cast butterflies, as shown in Fig. 14, have a very satisfactory flow characteristic if properly sized to the job. These units can usually be made to close quite tightly in view of the rigidity of the frame and of the butterfly.

Radial-vane-type dampers, of the type shown in Fig. 15, will give good flow characteristics if properly sized, though most dampers of this type are oversize, which result in a very poor flow characteristic. If the damper is made small enough to obtain a reasonably straight flow characteristic, there is likely to be some pressure loss at the wide-open position. This type of damper has its maximum effective opening at about 65-deg travel, so that there is no occasion to use greater travel than this in an effort to obtain increased capacity. The vanes can be made relatively tight closing if properly built and if arranged to overlap slightly in the closed position. From the standpoint of flow characteristic alone, this type of damper is not as desirable as the other types described but, since it is used primarily for the purpose of directing the gas flow into the inlet of the fan, the advantages gained thereby probably offset the disadvantages as a regulating device. It would appear that, with proper attention to the sizing of the fan inlet and thus the vanes, a reasonably good flow characteristic could be obtained without sacrificing pressure loss. One difficulty, of course, is the necessity for using different-size fan inlets for each installation.

A general conclusion is reached that most of the difficulties with dampers are due entirely to a lack of proper selection of size for each application, principally because no information was available to the designer. It is hoped that this work will stimulate some interest in this matter and lead others to make similar investigations and suggestions for improvement of this device which is so universally used.

Discussion

C. B. Arnold.[3] In the past, many control systems have doubtless proved to be only mediocre, not because the control regulators were inadequate but because the pieces of equipment controlled, such as dampers and the like, have had characteristics which did not lend themselves to satisfactory control, thus placing an undue requirement on the regulators. This fact, of course, has long been recognized by engineers and efforts have been made to correct the situation. However, it is felt that, in most cases, interest in the problem waned as soon as a reasonable improvement of a particular situation had been realized.

For ideal results, equal incremental movements of damper actuators should render equal incremental changes in flow through the dampers. Practically, however, this degree of refinement is not frequently necessary. It is necessary, however, that the size of a damper be suited to the particular conditions for which it is

Discussion continued on page 152.

intended, otherwise not even a close approximation of this ideal will be had. It is felt, therefore, that the authors have offered a very useful contribution by outlining a method of determining damper size so that it can be designed correctly, prior to its installation.

After the proper size of a damper has been ascertained, the further refinements relative to the connecting means between the damper and its power actuator should be given consideration. The arrangement mentioned by the authors, whereby equal increments of actuator movement produce small incremental movements of the damper near the closed position and, larger incremental movements near the open position, can be used to advantage in many cases. The merits of such an arrangement are as follows:

1 Actuator movement bears a closer relationship to flow through the damper.

2 Greater mechanical advantage is available when the damper is near the closed position, and frequently more force is required to operate the damper in this position.

3 Because of the additional mechanical advantage where it is most needed, as mentioned, smaller power actuators may be employed.

Granted that the size of a damper has been properly selected and that means of connecting the damper to the actuator have been satisfactorily arranged, there is still one other factor which may cause unsatisfactory results. This factor is damper unbalance. True, as the authors have stated, the torque-requirement characteristics of dampers are quite unpredictable, because of the unpredictable flow pattern ahead of and leaving the dampers. It is felt, however, that this unsatisfactory condition which frequently prevails should not be treated too lightly. One of the greatest causes of damper unbalance is the reduction of pressure, brought about by the increased velocity of air or gas between the damper leaves and between the dampers and their respective sealing strips, when the dampers are in the nearly closed position. If there is considerable overlap of one damper over another or of the sealing strips over the dampers, extreme forces are required to open them, and they tend to snap shut when approaching the closed position. If this unbalanced force were to change but gradually and always be in the same direction, no serious consequence would result. However, in many cases, the unbalanced forces sometimes suddenly decrease or actually reverse in direction, as the dampers move through some critical point. These changes of force required to operate the damper cause overtravel in damper movement on either side of the critical point, due to lost motion or yield in the linkage, and are bound to produce a hunting condition which no regulator can stabilize.

The writer has had some experience with dampers which had these unsatisfactory unbalance characteristics and was able to produce a satisfactory improvement of the characteristics on two-leaf dampers by providing unequal damper areas on either side of the damper shafts. This caused a counter-unbalanced force sufficient to cancel out a major part of the unbalanced force which originally prevailed. It is felt, therefore, that further study of this condition would be beneficial and might reveal some general rules and useful techniques which would insure at least an improvement of the condition and indicate some of the pitfalls to be avoided.

F. C. Smith.[4] The writer has been greatly interested in the authors' comments with regard to unbalance caused by overlap of the damper on sealing strips. Further comment by the authors concerning sealing strips would be greatly appreciated. For instance, what has been done along the lines of making use of spring-type strips somewhat comparable to the principles employed in ordinary building weather stripping? It appears to me that use of such sealing might greatly decrease the unbalanced condition which has been discussed.

[4] Editor, *Southern Power and Industry*, Atlanta, Ga. Jun. A.S.M.E.

C. L. Myers.[5] The authors have selected a subject that well deserves attention. The annual loss resulting from faulty dampers would be startling if there were any reliable figures available to establish it. Some index may be taken from the fact that our records indicate an average efficiency increase of 5.7 per cent for one group of installations after the dampers had been replaced; this figure does not take into account the item of equipment maintenance which is frequently effected.

The authors have defined the ideal flow characteristic, as shown in Fig. 16 of this discussion, and suggest that dampers be reduced in size to a point where the ratio of damper resistance to total system resistance is not less than 55 per cent at 30-deg opening. In order to visualize this recommendation, Fig. 16 includes the several flow curves corresponding to 55 per cent resistance and also, for comparison, curve 1 from Fig. 4 and curve 12 from Fig. 9 of the paper, to indicate the limits to which the curves can be moved by extremes of damper-size adjustment. The former corresponds to 98 per cent resistance at 30-deg opening and the latter, to 0 per cent resistance at 30-deg opening.

It is suggested that designers may find some difficulty in reducing damper sizes to those recommended without encountering problems of flow distribution in the system. Another problem may be found in that the indicated damper area, when divided by the necessary width, may result in a small height. Such dampers are more difficult to build to close clearances due to sag.

[5] Heacon, Inc., Philadelphia, Pa.

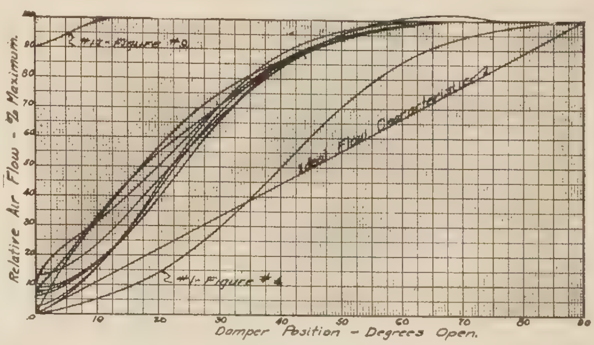

Fig. 16 Flow Curves Corresponding to 55 Per Cent Resistance

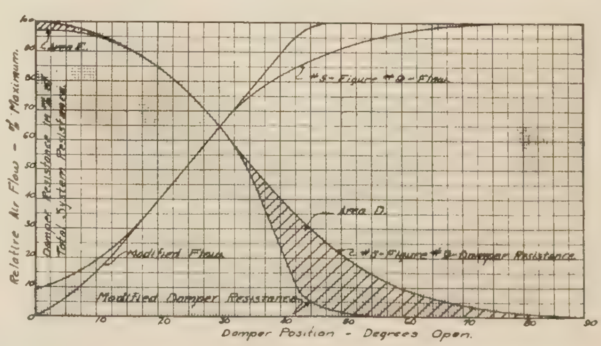

Fig. 17 Hypothetical "Modified-Flow" Curve and Curves 5 From Fig. 9 of the Paper

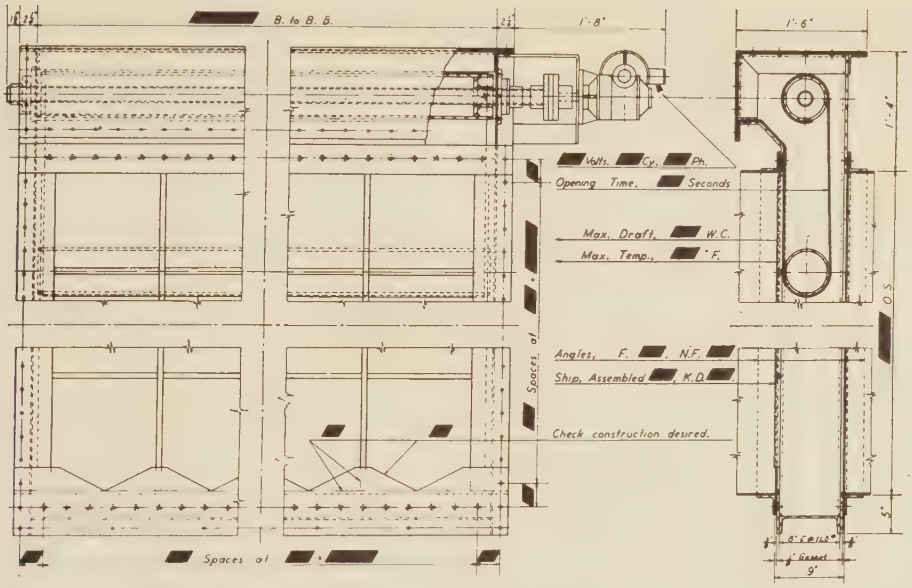

Fig. 18 Modern Damper Design

The increased leakage, resulting from the larger clearance necessary, has an adverse effect on the damper characteristic. These problems suggest a search for additional approaches.

The authors have made the alternative suggestion that the linkage, as shown in Fig. 1, be employed, but point out that such linkage must be maintained in perfect condition in order to obtain its benefits. They have also suggested that, in the case of multiple-leaf dampers with partitions, one or more sections can be blocked off. This procedure would seem to introduce distribution problems. Neither course will affect materially the leakage problem at the lower end of the curve.

Fig. 17 of this discussion shows curves 5 from Fig. 9 of the paper. Superimposed is an hypothetical "modified flow," which more nearly conforms to the desirable straight line and the "modified damper resistance" which would be required to produce such a flow curve. Area D indicates the need for less resistance which would be accomplished by more damper area. Area E indicates the need for more resistance or less damper area. This leads to the conclusion that the answer may be found in modification of the shape of the damper opening rather than rectilinear reduction of its size alone.

Such an approach to the problem is illustrated by Fig. 18 of this discussion. Obviously, the V-porting shown can be extended to provide any desired shape in the resistance curve, and thus any desired flow characteristic. Since there is no clearance between the moving part of the damper and its sealing strips, the leakage problem indicated by area E is eliminated, regardless of the size of the damper. Another thought involves the elimination of inclined planes in the path of flow, thus reducing turbulance and resistance. This is desirable in area D and modifies the amount of shaping necessary to obtain the desired result.

The authors have pointed out several other problems as follows:

1 Need for increased clearance for higher temperatures.
2 Power requirements.
3 Dynamic balance.
4 Shafts, bearings, and seals.
5 Leakage.

Examination of the design, illustrated by Fig. 18, establishes that large operating clearance is provided for the moving parts without introducing leakage. It also shows that ample strength to prevent sag in wide dampers is provided without introducing a large mass in the path of flow, that the weight to be supported is less and, further, that any sag which may develop does not require clearance effecting leakage. Since large operating clearance is provided, binding is eliminated. The problem of dynamic balance disappears automatically. Shafts can be made large in proportion to the weight supported. Bearings are in a favorable location more or less away from the flow and in a position which does not tend to distort to cause misalignment. Good seals should be provided in any case. These facts all add up to modest power requirements.

Leakage is a problem of a magnitude but little appreciated. Most dampers in service have been warped to an extent that the leakage has been materially increased from what it was when they were originally installed and the original leakage is usually considerable. The adverse effect of leakage on the flow characteristic is well illustrated by the several curves in the paper. Leakage of cold air into the breeching from cold boilers reduces available draft and thus capacity. Leakage of isolation dampers results in poor and even dangerous working conditions for maintenance crews. Elimination of leakage increases the range of efficient output. Leakage in an uptake damper results in a considerable loss of heat during banking periods. Leakage of air past a damper, controlling flow to a fuel bed, results in increased banking losses. Leakage in a by-pass damper permits heat to short-circuit the economizer or air heater. Leakage past an uptake damper to a breeching leading to an economizer reduces the temperature and increases the volume of gas passing through the

economizer, thus reducing its heat-absorbing efficiency and, passing on to the induced-draft fan, increases the power consumption, sometimes overloading the fan to the extent that full capacity is not attainable. Some dampers are so located that leakage results in recirculation, which leads to increased fan power and loss of capacity. Leakage, in some cases associated with air heaters or economizers, results in corrosion problems.

The authors have made a splendid contribution to a subject that can lead to very real improvement in the art of steam generation, conservation of fuel, and substantial economies.

Authors' Closure

The discussion by Mr. Arnold is appreciated as it emphasizes the need for greater care in the selection of dampers and the mechanisms for operating them. An important point brought out by Mr. Arnold is the fact that proper design of the linkage between the damper and the operating mechanism not only improves the flow characteristic, but reduces the torque requirements of the operating mechanism. We agree that the matter of damper unbalance requires further study, but this is beyond the scope of this paper. It is hoped that studies can be made later which will throw some additional light on this matter.

To answer Mr. Smith's question; the authors have had some experience with the use of sealing strips for decreasing the leakage in the closed position. We have used both weather-stripping construction and strips of flexible materials, such as asbestos tape, and find that satisfactory results can be obtained. The principal difficulty is the added cost, inasmuch as these strips must be fitted in the field, if satisfactory results are to be obtained. This adds considerably to the cost of the damper. The leakage on dampers of simple design, if properly sized, is not generally serious, and sufficient tightness can usually be obtained by the addition of metal stops on the damper frame.

The design of damper offered by Mr. Myers is interesting and unique. It offers the possibility of providing any desired area and flow characteristic. However, if suitable results are to be obtained, the area characteristic of this damper must be determined and a corresponding port-shape in the damper must be provided. It is for the purchaser to decide whether the desirable flow characteristic can be accomplished more easily and at less cost in this type of damper than in one of conventional design.

Mr. Myers is quite justified in pointing out that the damper which is properly sized does not give a straight-line relation between motion and flow increase. However, it will be noted that the average of the various curves, shown in Fig. 17 of his discussion, which incidentally do not represent the best that can be obtained for each damper type, still shows less than a $2^1/_2$ to 1 change in slope over the effective range of travel. By arranging the linkage between the operating mechanism and the damper to use only the effective portion of damper travel, which in this case is approximately 70 deg, and incorporating some angularity in the linkage, a very nearly uniform slope could be obtained. In most cases no difficulty would be encountered with dampers having a flow characteristic similar to the average of these curves with or without angularity in the linkage, as the change in slope is not sufficient to present any regulation problems.

Operating Experiences With High-Pressure High-Temperature Unit at Des Moines

By J. F. McLaughlin,[1] Des Moines, Iowa

Operating experiences, with performance records for 1939 and 1940, with a 35,000-kw turbine generator operating at 1290 psi and 925 F, and a steam generator which has a capacity of 420,000 lb per hr are presented, and changes made to overcome failures and outages are described.

The latest addition to Des Moines power station No. 2 at Des Moines, Iowa, consists of one 35,000-kw turbine generator operating at 1290 psi 925 F, without reheat, running at 3600 rpm, and exhausting to a condenser. Steam is supplied by a steam-generator unit which has a capacity of 420,000 lb per hr and burns Iowa pulverized coal.

The station piping is so arranged that steam to the high-pressure turbine can be supplied from a group of 365-psi boilers and steam to the 365-psi turbines can be furnished from the high-pressure boiler through a desuperheater. One boiler feed pump is driven by a 1250-hp motor, the other by a 1250-hp turbine receiving steam normally from the 365-psi boilers. Steam for this turbine can also be obtained from the high-pressure boiler through an auxiliary desuperheater. All other auxiliaries are driven by electric motors.

The condenser has a divided water box with two circulating water pumps so arranged that either pump can furnish water to both sides of the condenser. The circulating water is automatically treated with chlorine.

The steam-generator unit has two induced-draft fans, two forced-draft fans, two air heaters, and three pulverizers of which any two are sufficient for full load.

The turbine was first started Nov. 23, 1938, with steam from the 365-psi boilers. The unit was operated at high pressure from Dec. 14 to Dec. 20, 1938, when it was shut down for completion of construction work.

The operating record of the unit for 1939 and 1940 is shown graphically in Figs. 1 and 2, and indicates the time, duration, and cause of each outage, major repair, and change made and the maximum daily load carried on the unit.

Turbine Generator Operation

The availability factor of the turbine was 79.8 for 1939 and 95.5 for 1940. There were ten outages of the unit in 1939, three of which were forced outages due to the turbine. There were seven outages of the unit in 1940, two of which were also forced outages due to the turbine.

The unit was placed in service Jan. 5, 1939, and the load was held at 15,000 kw until the next day when the load was increased to 32,000 kw. Wear, caused by misalignment of some of the parts, was noticed in the thrust bearing. Adjustments were made and the unit resumed operation. On Feb. 10 several groups of high-pressure reaction blading were replaced with a modified design to relieve the axial thrust. A different type of thrust bearing was also installed. Some broken blades were found in the two impulse rows, and both rows were replaced with blades of the original design. New dummies and nozzle blocks were also installed.

After starting the turbine on March 24 the load was increased to 18,000 kw at which time steam was found to be leaking through a thermometer well which had been installed in the casing at the reaction inlet. After the unit had been shut down it was found that the thermometer well had broken off inside the turbine casing. When the high-pressure cover was removed some broken blades were found in the second row of impulse blading. It was apparent that the turbine blades had broken first and the impact of the broken pieces caused the thermometer well to break. All of the impulse blades in the second row were removed and the unit was placed in service March 31. No restrictions of any kind were imposed on the amount of load to be carried, and on April 11 the unit carried a load of 43,750 kw at 100 per cent power factor which is full-load rating of the generator. The position of the turbine inlet valves indicated that the turbine could have carried considerably more load. The turbine was inspected April 21 to 29, and everything was found to be in good condition.

The unit was next taken out of service June 15, at which time new impulse blades were installed in both first and second rows. See Fig. 3. These blades had been redesigned, and in this redesign the results of latest design developments[2] in connection with partial-admission blading were taken into consideration.

The turbine was placed in service July 3 and operated without further inspection or changes until Feb. 6, 1940. There were five outages during this period but none of these was due to the turbine. The turbine was given a complete inspection during the outage between Feb. 6 and March 5. The first row of impulse blading was in good condition but one blade in the second row was broken immediately under the shroud and two other blades were cracked in the same region. Subsequent examination revealed that these three blades had extremely sharp corners with insufficient radii in the vicinity of the failures. New second-row blading was installed with the blades made heavier under the shrouding, welded in groups of two at the top and bottom of the blades, and stress-relieved before installation. See Fig. 4. The entire impulse element has since continued to operate satisfactorily without trouble of any kind.

Two forced outages of the unit due to the turbine took place in 1940, one caused by a leak in a weld on the oil piping and the other caused by a broken tension screw in the governor; the latter allowed the turbine inlet valves to close instantaneously.

The turbine was inspected in October, 1940, and all blading was found to be in good condition. Some difficulties had been experienced with sticking of the control valves. A new-type cage was installed on these valves during this outage and this has entirely corrected this trouble. A study has been made of the relation between governor movement and frequency and this showed especially good speed regulation.

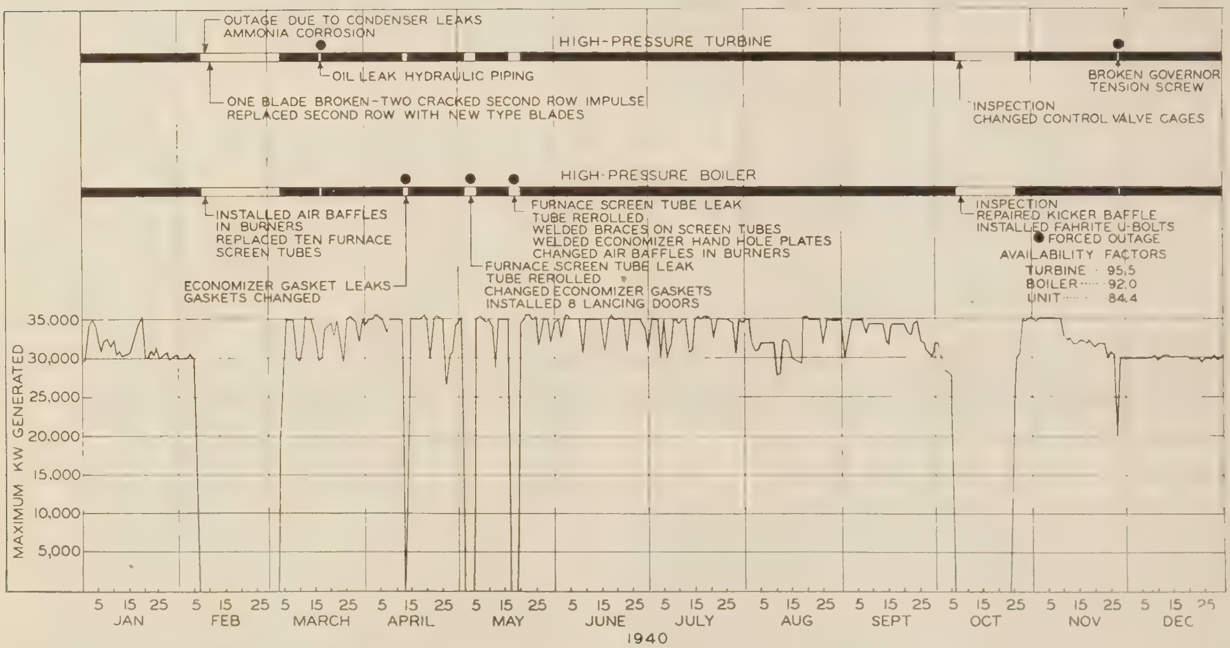

Fig. 2 Operating Record, High-Pressure Unit—1940

Condenser

No operating difficulties have been encountered with the condenser or its auxiliaries. Condenser air leakage at full load averages 0.43 cfm. In December, 1939, and January, 1940, the flow of the Des Moines River reached the lowest stage ever recorded with the result that the circulating water entering the condenser amounted to nothing more than sewage. This was before the Des Moines sewage-disposal plant was operating. Recirculation of the circulating water raised the temperature of the water to 75 F. Make-up for the evaporators was obtained by softening river water in a treating plant. Since there was no convenient means for reducing the ammonia content of the treated water, the steam and condensate became polluted with ammonia by way of the evaporator circuit. Measurements of the condensate at the hot well indicated presence of 5 to 6 ppm ammonia nitrogen.

On Jan. 17 a considerable condenser leak occurred, so that it seemed that a tube must have broken. One half of the condenser was drained at a time and it was found that 18 tubes were leaking. Further investigation proved that corrosion had taken

FIG. 3 NEW-TYPE IMPULSE BLADES INSTALLED IN JUNE, 1939

place from the steam side of the condenser. A few of the tubes was found to be split, but most of the leaks were in the tops of the tubes just inside of the tube sheet at the water inlet end of the first pass. The majority of the holes were found to be plugged with sewage, which no doubt accounts for the fact that there were no condenser leaks previous to Jan. 17. The air take-off of this condenser is at the top and at both ends, and although the concentration of ammonia at the air take-off was not measured, there is no doubt that it was exceptionally high. A total of 124 leaks was found before the unit was shut down Feb. 6. During the shutdown 1315 tubes were replaced owing to the corrosion, all of which was in the top half.

Make-up for the treated-water plant has since been obtained from a previously abandoned well which has only a trace of ammonia. Subsequent inspection of the condenser indicates that further corrosion has been eliminated.

STEAM GENERATOR

The availability factor of the steam generator was 78.5 in 1939 and 92.0 in 1940. Of the ten outages of the unit in 1939, six were due to the boiler, five of which were forced outages. Of the seven outages of the unit in 1940, three were due to the boilers, all of which were forced outages.

The boiler was placed in service Jan. 5, 1939. The first month's operation presented no difficulties, owing, apparently, to the reduced rating caused by turbine troubles. It did indicate, however, the necessity of moving lancing doors and the installation of others to facilitate the removal of slag. As noted in Figs. 1 and 2, lancing doors have been moved or installed at various times as further experience indicated where they could be used to advantage. Observations made during this first run also indicated the need for some changes on the air heaters to prevent plugging at the cold end. Air recirculators and a cold-air by-pass were later installed on the air heaters and these are used at light loads to prevent condensation of the moisture in the flue gas upon the air-heater plates. The average temperature of the air into and of the gas out of the air heaters is kept at or above 230 F. This, together with the use of superheated steam for sootblowers, has kept the air heaters clean.

The five forced outages between June 15 and Sept. 25 were due to leaks in the rolled joints of the furnace screen tubes caused by chunks of slag falling onto these tubes from the furnace side walls. The front and rear walls and the lower side walls of this furnace consisted of closely spaced finned tubes, but the upper side walls were built of plain tubes spaced $10^1/_4$ and $15^3/_8$ in. on centers with the firebrick between the tubes exposed to the furnace. The molten slag adhered to the firebrick and after solidifying by cooling gradually built up to considerable size. The weight of this slag eventually became too great to remain attached to the side walls and chunks would fall, striking the floor screen tubes 20 to 25 ft below. This slag weighed about 200 lb per cu ft, so that a piece two feet square and four inches thick might weigh 250 to 275 lb. See Fig. 5.

During the outage in November, 1939, these plain tubes in the upper side walls were removed and closely spaced finned tubes were installed. See Fig. 6. This change, together with changes in the angle of the burners and installation of air baffles to deflect the secondary air into the coal stream, materially reduced the amount of slag adhering to the walls.

A section through the steam generator is shown in Fig. 7.

Two more outages occurred in May, 1940, from leaks in the screen tubes caused by falling slag, although there had been no evidence of any heavy chunks in the ashpit as had previously been the case. It was found that a thin layer of slag averaging

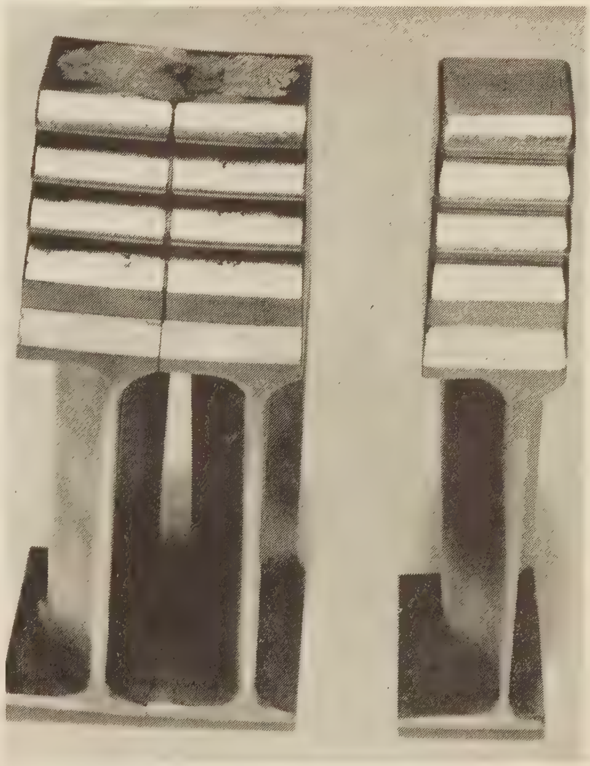

FIG. 4 NEW-TYPE IMPULSE BLADES INSTALLED IN SECOND ROW, FEBRUARY, 1940, AT LEFT, COMPARED WITH PREVIOUS BLADE

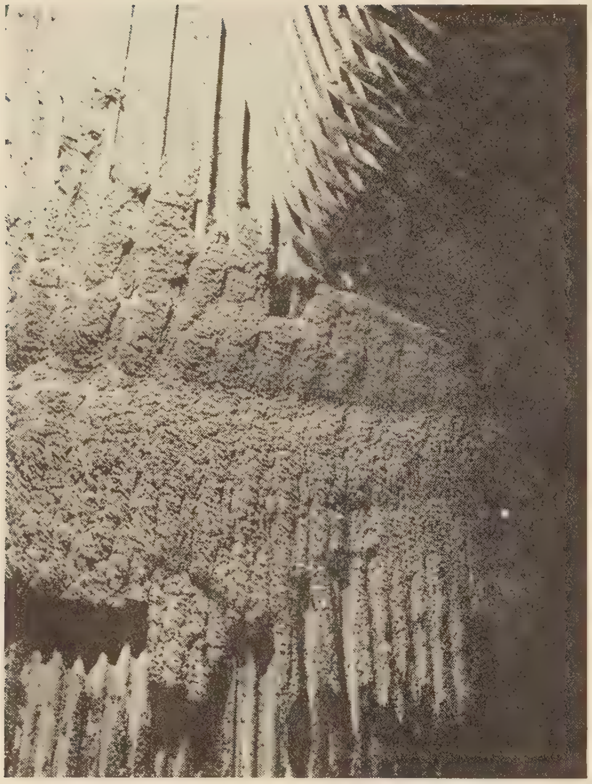

Fig. 5 Slag Adhering to Refractory Between Upper Side-Wall Tubes, August, 1939

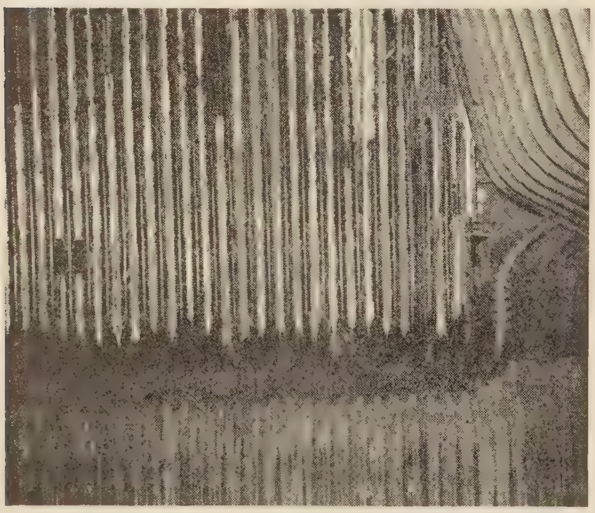

Fig. 6 New Finned Tubes in Upper Side Walls, Installed November, 1939

about one inch in thickness and about four feet square had been accumulating on the side wall about 15 ft above the screen tubes. As this slab would weigh about 275 lb, it could readily cause a leak in the rolled joint of the tube if it should strike the tube just right. Additional changes in the secondary-air baffles with more frequency hand lancing at this location has eliminated this difficulty. Three screen tubes on each side of the furnace were tied together by welding steel braces to the tubes at two points to stiffen up the tubes.

One outage in 1940 was due to leaks in economizer hand-hole gaskets. As the piping and economizer tubes were welded to the header, the hand-hole plates were also welded, so no more leaking has taken place.

In the original installation, two stationary sootblowers designated *A* and *B* were located back of the second row of boiler tubes facing the furnace; a third blower of the rotary type designated *C* was installed in front of the convection superheater. Elements *A* and *B* were later changed to the rotary type. Although these three elements were made of the best possible material for the service, the life of the element was very short. In addition to the short life, one type of nozzle had a tendency to grow and close up: another type tended to disintegrate and cut out. Elements *A* and *B* were discontinued since they were ineffective in removing slag that formed on the front of the tubes. Element *C* was replaced with a telescopic blower installed in front of the superheater. Retractable wall blowers have also been installed in the side walls and front wall above the mud-drum elevation. Hand lancing has become unnecessary in those sections of the furnace provided with the telescopic and retractable blowers. No method other than hand lancing has been found which will effectively remove the slag where the temperature is high enough to make it sticky.

Some trouble was experienced with the burning of baffle castings and U-bolts in the high-temperature zone of the boiler. These troubles have been eliminated by the use of alloy steel of 25 per cent chromium, 12 per cent nickel.

There has been considerable erosion of the blades of the induced-draft fans at the center of the rotor. The worn parts of the blades were repaired by welding with "Abrasoweld" which was applied with the electric arc. This appears to be a satisfactory method of repair.

The induced- and forced-draft fans are driven by constant-speed motors through hydraulic couplings. Considerable sludging of oil was experienced when using oil having a viscosity of 195; however, since changing to an oil having a Saybolt Universal viscosity of 155 sec, this trouble has been eliminated.

The original rolls and rings in the pulverizers had a life of about 20,000 tons. Changes have been made in the shape and material which indicate a life of about 40,000 tons with a reduction in cost per ton. Different materials have also been used in the pulverizer liners, exhauster liners, and blades, all of which have reduced the cost per ton. The exhauster blades have a life of from 8500 to 10,500 tons. The blades have been made of structural plate, abrasive-resisting plate, four-way plate, and chrome-manganese plate. Structural-steel plates with beads of Abrasoweld are now being tried on one of these exhausters.

The pulverizers have a capacity of 12 tons per hr each and require 15 kwhr per ton at full load with a fineness of coal as follows: 98.0 per cent through 50-mesh screen; 92.0 per cent through 100-mesh screen; and 77.0 per cent through 200-mesh screen.

The coal used is Iowa screenings with the following analysis:

Moisture as received, per cent	16.50
Ash, per cent	17.50
Volatile, per cent	30.00
Carbon, per cent	36.00
Heating value, Btu per lb	9200
Sulphur, per cent	4.5
Ash: Initial deformation, F	1685
Softening point, F	1950
Fluid temperature, F	2110

The high amount of moisture, ash, and sulphur and the low softening point of the ash all tend to aggravate the difficulties

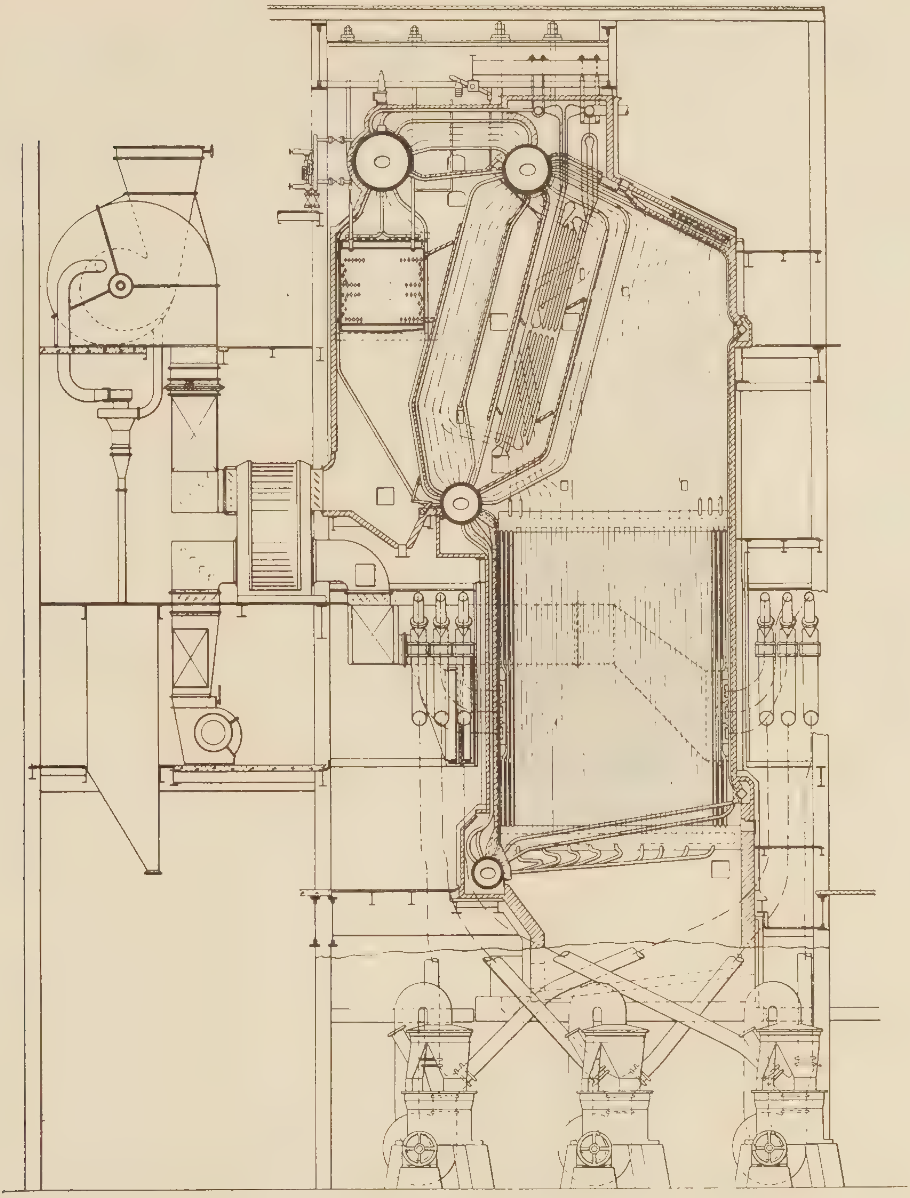

FIG. 7 SECTION THROUGH STEAM GENERATOR

inherent in pulverized fuel, yet owing to the fact that this station is located in the center of the Iowa coal field, it is the most economical fuel to use.

The combustion control has proved to be very reliable. It is completely automatic and regulates steam pressure and temperature, water, coal and air flow, and coal-air temperature from the pulverizers. Automatic regulation of steam pressure and temperature is also provided through the desuperheater, reducing the steam pressure to 365 psi and the temperature to 700 F for the 365-psi turbines in case of loss of the high-pressure turbine.

Some difficulty has been experienced with the motor-driven boiler feed pump owing to porous material in the pump diffusers, leaks having occurred mainly in the machined joints where two diffusers fit together, reducing the capacity of the pump. This happened in the original rotor twice and in a spare rotor once. These leaks did not develop until April, 1940, so that the difficulty has not yet been eliminated. However, the manufacturer is now rebuilding one of these rotors making use of different material.

The unit is equipped with five feedwater heaters, two of which are located between the hot-well pump and the boiler feed pump, and the other three between the boiler feed pump and the economizer. Heaters Nos. 3, 4, and 5 are designed for a working pressure of 1800 psi and are of the horizontal condenser type with floating heads. Nos. 3 and 4 had $^3/_4$-in. OD, 9 Bwg arsenical-copper tubes and No. 5 had $^3/_4$-in. OD, 12 Bwg copper-nickel tubes. Heaters Nos. 3 and 4 are subcooled. The drip cascades from No. 5, which is the high-pressure heater, through each of the other heaters to the drip pumps. Several leaks developed in No. 4 heater in both tube sheets, and although the tubes were rerolled sufficiently to stop the leaks under a hydrostatic test, the leaks persisted under operating conditions. It then became

impossible to stop the leaks by rerolling, so a new tube bundle was made for this heater using $^3/_4$-in. OD 12 Bwg, copper-nickel tubes with return bends instead of the floating heads.

No difficulties have been encountered with boiler-water circulation or carryover. Total solids in the boiler drum are maintained at 100 to 200 ppm by means of a continuous blowdown, amounting to about 0.5 per cent of the total evaporation. A continuous record of conductivity is made at the hot well, boiler-feed suction header, saturated or superheated steam, and distilled water from the evaporators.

Discussion

M. K. Drewry.[3] Coal, having an ash-fusion temperature of 1950 F, with 17.5 per cent ash, presents a difficult boiler-unit design and operating problem. That the Des Moines unit has been able to afford $4^1/_2$ months continuous service at high loads with this unfavorable fuel is creditable to the designers and operators.

About 90,000 Btu per sq ft per hr of furnace heat-absorbing surface is understood to be present in this furnace. This relatively low heat-release rate, or in other words, proportionately high "black" cooling surface, seems of major significance in explaining why the Des Moines unit operates well with bad fuel.

This case of controlling slagging under conditions of exaggerated difficulty points the way to its control in all other boiler units. It is a definite answer to the practicability of burning all coals when maintaining their ash in the dry state.

John Van Brunt.[4] This paper, dealing with operating experiences at Des Moines power station No. 2, is very interesting and instructive. The author should be given credit for his persistence in meeting and solving many problems that are inherent in burning coal of the character described and used in this plant. Some twenty or twenty-five mines are drawn upon for fuel, and the author will agree that some of the coal used is not as good as that referred to in his paper. Much of the coal contains as high as 6 per cent sulphur as well as a very considerable amount of iron.

This installation is one of the type requiring high steam temperature when burning low-fusion-ash coal. In order to avoid fusion of ash in the superheater, the furnace must be so designed as to give the lowest possible entering-gas temperature consistent with the superheater requirements. Despite the low softening temperature and the extremely low deformation temperature, there has been no troublesome fusion of ash in the superheater. Such ash as is deposited on the superheater elements can be easily removed by hand-lancing, and at the present time by telescopic soot blowers, as described by the author.

An availability factor of 92 per cent for 1940 shows that the operation is well organized and in competent hands.

The combustion in this furnace is excellent, as evidenced by repeated analyses of the fly ash, showing less than 1 per cent carbon in the fly ash, corresponding to a carbon loss of about 0.5 per cent.

A slagging-bottom furnace would be better suited for burning this type of coal. Less ash would pass through the boiler and superheater, and the handling of the ash from the slag-bottom furnace is simpler and easier than from a dry-bottom furnace. The gas temperature leaving the furnace would be the same or slightly lower, and less heavy slag would deposit on the walls. In all probability, such a furnace would be less affected by variations in the coal than is a dry-bottom furnace.

FOREWORD

This issue of the Membership List brings together in one book the personnel of the Council and committees of the Society, the Constitution, By-Laws, and Rules, and the alphabetical and geographical lists of members of all grades, including the members of the Student Branches. It also contains an index of members engaged in professional consulting services. This complete issue forms Section Two of the Transactions of The American Society of Mechanical Engineers for February, 1942.

Page Numbers of Society Records

The "RI" preceding page numbers in the first section of the book is the symbol for Record and Index, and these pages, as well as later issues of the Society Records for the year, will form part of the bound volumes of Transactions of the Society. The use of this section will be facilitated by reference to the index on pages RI-40 and 41 for personnel of Council and committees and to the index on pages RI-54-56 for the Constitution, By-Laws, and Rules.

Directory of A.S.M.E. Members

The Directory itself contains the names of all those who were members of the Society in good standing on November 1, 1941. It is divided into two sections, the Alphabetical List, which gives the complete listing for each member, and the Geographical List, which gives the names of those in each locality and shows the Local Section to which each place is assigned.

Alphabetical List

Each entry in the Alphabetical List covers the member's grade and year of membership, symbols indicating registration in Professional Divisions, Society office held or award received, and his address.

The dates and letter symbols in parentheses immediately following the name of a member indicate his grade of membership and year of election or promotion to each grade. The letter symbols are H—Honorary; F—Fellow; A—Associate; and J—Junior. Where a single date is not accompanied by a letter symbol, the grade of member is to be understood. Also where several dates are given, with no letter symbol, the final date indicates the year of election to full membership.

One or more letter symbols appearing in a second parenthetical group designate the Professional Divisions of the Society in which the member registered when supplying information for the Membership List. Prior or subsequent registrations are not included. The symbols are given in alphabetical order, not according to order of interest. The key to the symbols is as follows:

A—Aviation	G—Graphic Arts	P—Petroleum
B—Applied Mechanics	H—Hydraulic	R—Railroad
C—Management	J—Metals Engineering	S—Power
D—Materials Handling	K—Heat Transfer	T—Textile
E—Oil and Gas Power	L—Process Industries	W—Wood Industries
F—Fuels	M—Production Engineering	

The addresses given are those on record on November 1, 1941. Owing to world conditions it was not possible to secure up-to-date addresses for many members outside the Western Hemisphere. Where more than one address is given for a member, the first is the business address and is usually followed by the address to which he desires his mail sent. In some instances the "residence" address is given. This was done in cases where members desired to be placed in the Geographical List under city headings which are not part of the business or mail addresses.

Geographical List

The United States, including its territories and dependencies in which members are located (Alaska, Canal Zone, Hawaii, Philippine Islands, and Puerto Rico) is placed first in the geographical list. It is followed by other countries in the Western Hemisphere, Canada, Mexico, Central America, the West Indies, and South America, in the order enumerated. In the Eastern Hemisphere the individual countries are listed alphabetically under the headings Africa, Asia, Europe, and Oceania. Cross references to the territories and dependencies of the United States are inserted at the proper points and other cross references cover variations in names of countries. Facing the first page of this section is an index giving the number of the page on which each country will be found.

In the United States and Canada, the name of each city which falls within a Local Section is followed by the name of that Section. Members residing in cities where no Section is mentioned may affiliate with any Section, without additional dues, upon request to the headquarters of the Society.

Professional Consulting Service Index

This section, entitled "Professional Service Index," appeared for the first time in the 1940 Membership List. It groups geographically about 700 members engaged in independent consulting or other professional service, as compiled from the special reply cards sent to members. The Index is confined to consultants established either as individuals or connected with consulting organizations and is made up of consulting engineers, management consultants, specialists, patent attorneys and agents, constructors and contractors. Only those rendering service independent of or not influenced by the manufacture or sale of a product are being listed. Omissions are due in most part to failure on the part of members to furnish the information requested.

Supplementing this Index and immediately following it is a "Classified Specialty List" of 54 of the consultants advertising their specialized lines of practice.

Restrictions on Use of Membership List

This Membership List is issued for the personal use of members of The American Society of Mechanical Engineers in connection with Society and professional affairs. Each member is expected to conserve it and not to permit his copy to be used for the basis of circularization. Such use is annoying to fellow members.

The American Society of Mechanical Engineers

HEADQUARTERS: 29 West 39th St., New York, N. Y.
MID-WEST OFFICE: Room 1617, 205 West Wacker Drive, Chicago, Ill.

The members of the Council and of its standing and special committees given on the following pages are those in office on January 1, 1942, serving for the official year 1941-1942. The terms of office of members of other committees are not fixed by the official calendar.

B. G. Elliott, Group VI
H. T. Avery, Group VII

AKRON-CANTON

Organized: 1920
Territory: Counties of Richland, Ashland, Medina, Summit, Portage, Wayne, Stark, Holmes, Tuscarawas, Carroll, and Coshocton in Ohio
Place of Meeting: As selected monthly
Number of Members: 157

Executive Committee

A. G. Walker, *Chairman*
O. J. Horger, *Vice-Chairman*
A. E. Shetler, *Secretary-Treasurer*
M. R. Bowerman
D. H. Cornell
H. G. Doster
James Forrest
S. H. Hahn
L. B. Holmes
E. Homer Kendall
J. H. Vance

ANTHRACITE-LEHIGH VALLEY

Organized: 1920, as Lehigh Valley; reorganized, 1928, as Anthracite-Lehigh Valley
Territory: Counties of Bradford, Susquehanna, Wayne, Sullivan, Wyoming, Lackawanna, Columbia, Luzerne, Monroe, Pike, Schuylkill, Carbon, Berks, Lehigh, Northampton in Pennsylvania, and Warren in New Jersey
Place of Meeting: One meeting annually at Allentown, Bethlehem, Easton, Hazleton, Pottsville, Reading, Scranton, and Wilkes-Barre
Local Organization: The Engineers' Club of Lehigh Valley
Number of Members: 215

Executive Committee

Walter Tallgren, *Chairman*
W. W. Hagerty, C. M. Merrick, R. H. Porter — *Vice-Chairmen*
C. H. Folmsbee, *Secretary*
R. L. Willis, *Treasurer*
J. R. Connelly, J. A. Gish, Jr., E. A. Gorney, Walter Greacen, III, C. C. Hertel, J. A. Lloyd, R. E. Moyer, Jr., L. E. Mylting — *Managers*
J. W. Bliss, C. R. Dieckman, C. H. Folmsbee, H. F. Hatfield, W. G. McLean, H. C. Schweikart — *Assistant Managers*

ATLANTA

Organized: 1913
Territory: Radius of sixty miles from Atlanta, Ga.
Place of Meeting: Atlanta Athletic Club
Luncheon meeting every Monday at 12:30 p.m. at Atlanta Athletic Club
Number of Members: 93

Executive Committee

A. H. Koch, *Chairman*
J. M. Rittelmeyer, *Vice-Chairman*
R. N. Benjamin, *Secretary*
J. A. Dodd
W. A. Hinton
A. C. Keiser, Jr.
W. J. McAlpin
J. W. Parker, Jr.

BALTIMORE

Organized: 1916
Territory: Radius of thirty miles from Baltimore, Md.
Place of Meeting: Engineers Club of Baltimore
Number of Members: 271

Executive Committee

C. F. Merriam, *Chairman*
W. D. Boynton, *Secretary-Treasurer*
E. M. Benjes
Sidney Hausman
Herman Hollerith, Jr.
G. W. Keen
J. M. Mousson, II
S. F. Robertson
L. F. Welanetz

Junior Group

John Doering, *Chairman*
H. W. Hyde, *Secretary-Treasurer*
E. M. Benjes
L. R. Hartman
W. A. Hazlett

BIRMINGHAM

Organized: 1915
Territory: Radius of sixty miles from Birmingham, Ala.
Place of Meeting: Tutwiler Hotel
Number of Members: 77

Executive Committee

J. M. Gallalee, *Chairman*
T. M. Francis, *Vice-Chairman*
R. G. B. Bourne, *Secretary*
J. B. Bell
H. S. Kent

BIRMINGHAM

(*Continued*)

Junior Group

F. E. Vann, *Chairman*
A. V. Jannette
H. S. Kent

BOSTON

Organized: 1909
Territory: Radius of thirty miles from Boston, Mass.
Place of Meeting: Mass. Inst. of Technology
Local Organization: Engineering Societies of New England
Number of Members: 573

Executive Committee

J. W. Zeller, *Chairman*
H. J. Brown, *Vice-Chairman*
R. A. Spence, *Secretary-Treasurer*
Kerr Atkinson
G. A. Orrok, Jr.
S. S. Perry

Junior Group

W. J. O'Malley, *Chairman*
R. Hermann, *Vice-Chairman*
R. A. Spence, *Secretary-Treasurer*
E. I. Bower
Sabin Crocker, Jr.

BRIDGEPORT

Organized: 1917, as a Branch of Connecticut Section; reorganized as a Section, 1923
Territory: Fairfield County, Conn.
Place of Meeting: Stratfield Hotel
Local Organizations: The Bridgeport Tool Engineers Association; The Bridgeport Engineers Club
Number of Members: 125

Executive Committee

Rudolf Beck, *Chairman*
J. M. Lucarelle, *Vice-Chairman*
W. H. Sniffen, *Secretary*
A. W. Hagan, *Treasurer*
A. H. Beede
C. N. Hoagland
R. C. Moody
O. J. Richmond
J. W. Roe
J. D. Skinner
E. R. Spaulding
C. P. Wicks

Junior Group

E. L. Uhl, Jr., *Chairman*
E. A. Sammis, *Vice-Chairman*
A. H. Beede, *Secretary*
C. A. Buss
A. E. LaRocque
W. E. Viscusi

BUFFALO

Organized: 1915
Territory: Radius of thirty miles from Buffalo, N.Y.
Place of Meeting: Mareen Hotel, Main St. at Utica
Local Organization: Engineering Society of Buffalo
Number of Members: 206

Executive Committee

N. C. Barnard, *Chairman*
C. A. Ross, *Vice-Chairman*
Melville C. Case, *Secretary*
Carlos E. Harrington, *Treasurer*
L. R. Burmester
H. W. S. La Vier
W. A. Miller
J. L. Yates, *Junior Adviser*
Stephen Wagner, *Student Adviser*

CENTRAL ILLINOIS

Organized: 1937
Territory: All the territory in Central Illinois between the following counties on the northern boundary: Bureau, LaSalle, Knox, Stark, Putnam, Marshall, Livingston, Peoria; counties on the southern boundary: Pike, Scott, Morgan, Sangamon, Macon, Piatt, Douglas, and Edgar
Place of Meeting: Hotel Pere Marquette or Caterpillar Show Room
Number of Members: 81

Executive Committee

C. G. A. Rosen, *Chairman*
W. W. Babcock, *Vice-Chairman*
R. E. McClain, *Secretary-Treasurer*
J. L. Deffenbaugh, *Assistant Secretary*
L. E. Johnson
D. G. Ryan
F. L. Meyer, *Past-Chairman*

Junior Group

L. Wolnaik, *Chairman*

CENTRAL INDIANA

Organized: 1916
Territory: Radius of eighty miles from Indianapolis, within Indiana
Place of Meeting: Indianapolis Athletic Club
Local Organization: Indiana Engineering Society
Number of Members: 163

Executive Committee

R. B. Bass, *Chairman*
C. L. Kline, *Vice-Chairman*
R. W. Gausmann, *Secretary-Treasurer*
H. A. Bolz
J. A. Drogue
R. B. Holmes
J. K. Loman

CENTRAL PENNSYLVANIA

Organized: 1921
Territory: Radius of approximately sixty miles from State College, Pa.
Place of Meeting: State College and Altoona, Pa.
Number of Members: 76

Executive Committee

J. O. P. Hummel, *Chairman*
H. A. Sorensen, *Secretary-Treasurer*
J. S. Doolittle
G. L. Guillet
F. T. Mavis
R. Y. Sigworth
F. C. Stewart

CHICAGO

Organized: 1913
Territory: Radius of fifty miles from Chicago, Ill.
Headquarters: Mid-West A.S.M.E. Office, Room 1617, 205 West Wacker Drive, Chicago, Ill.
Place of Meeting: Civic Opera Bldg., 20 N. Wacker Dr.
Meetings: Tuesday, 7:30 p.m.
Local Organization: Western Society of Engineers
Number of Members: 826

Executive Committee

C. C. Austin, *Chairman*
H. M. Black, J. R. Michel, P. A. Stephenson, *Vice-Chairmen*
F. B. Orr, *Secretary-Treasurer*
R. H. Bacon

W. G. Chappell
R. C. Clough
J. J. Gahan
R. W. Helbig
J. A. Johnston
M. J. Kilroy
D. I. Payne
A. W. Vande Ven

CINCINNATI

Organized: 1912
Territory: Radius of thirty miles from Cincinnati, Ohio
Place of Meeting: Engineers' Club Rooms, Ninth & Race Sts.
Local Organization: Engineers' Club of Cincinnati
Number of Members: 192

Executive Committee

E. H. Mitsch, *Chairman*
H. B. Brandt, *Vice-Chairman*
R. L. Smith, *Secretary-Treasurer*
J. J. Braun
Hans Ernst
R. S. Hyatt
C. L. Koehler
R. E. LeBlond
G. F. Lockeman
F. W. Spalding

CLEVELAND

Organized: 1918
Territory: Counties of Lorain, Cuyahoga Lake, Geauga, and Ashtabula in Ohio
Place of Meeting: Cleveland Engineering Society Club
Local Organization: Cleveland Engineering Society
Number of Members: 243

Executive Committee

J. P. Dearasaugh, *Chairman*
D. K. Wright, *Vice-Chairman*
E. R. McCarthy, *Secretary*
F. A. Barnes, *Treasurer*
M. E. Lange
McRea Parker
R. R. Slaymaker
W. G. Stephan
A. G. Trumbull

COLORADO

Organized: 1919
Territory: Entire State of Colorado
Place of Meeting: Albany Hotel, Denver, Colo.
Local Organization: Colorado Engineering Council (Colorado Society of Engineers)
Number of Members: 74

Executive Committee

R. F. Throne, *Chairman*
Durbin Van Law, *Vice-Chairman*
J. C. Reed, *Secretary-Treasurer*
L. D. Crain
A. L. Hill
F. A. Lockwood
N. A. Parker
F. H. Prouty
G. A. Richter
J. T. Strate
G. H. Woelbing

COLUMBUS

Organized: 1920
Territory: Counties of Union, Delaware, Licking, Madison, Franklin, Fayette, Pickaway, and Ross in Ohio
Place of Meeting: Battelle Memorial Institute and The Ohio State University
Number of Members: 78

Executive Committee

H. R. Limbacher, *Chairman*
H. M. Blank, *Vice-Chairman*
E. J. Lindahl, *Secretary-Treasurer*
A. I. Brown
C. Z. Gillivan
S. M. Marco
J. L. Purdy
E. M. Sampson

DAYTON

Organized: 1926
Territory: Counties of Drake, Miami, Champaign, Preble, Montgomery, Greene, and northern part of Butler and Warren in Ohio
Place of Meeting: Engineers' Club of Dayton
Local Organization: Engineers' Club of Dayton
Number of Members: 110

Executive Committee

L. R. Bridge, *Chairman*
C. W. Ball, *Vice-Chairman*
E. G. Johnson, *Secretary-Treasurer*
H. M. Gano
J. J. Healy
P. H. Kemmer
A. R. Weber
C. H. Wight

DETROIT

Organized: 1916
Territory: Radius of thirty miles from Detroit, Mich.
Place of Meeting: Place varies
Local Organization: Engineering Society of Detroit
Number of Members: 454

Executive Committee

A. M. Selvey, *Chairman*
J. W. Armour, *Secretary-Treasurer*
E. J. Abbott
C. L. Brattin
J. A. Carlin
L. W. Lentz
R. W. Parkinson
J. H. Spurgeon
H. L. Walton
R. K. Weldy
T. E. Winkler
Tom Jeffords, *Ex-Officio*

Junior Group

Paul Hoffman, *Chairman*
B. W. Lane, M. A. Simpson — *Committeemen*

EAST TENNESSEE

Organized: 1922
Territory: All counties in Tennessee east of the west boundary of Scott, Morgan, Cumberland, White, Warren, Coffee, Moore, Franklin; Belle County in Kentucky; and Rossville, Dade, Walker, Cattasa, Whitfield, Murray, Gordon, Chattooga in Georgia
Place of Meeting: Places varies
Local Organization: Chattanooga Engineers Club and Knoxville Technical Club
Luncheon Meeting every Monday noon at Chattanooga Engineers Club
Number of Members: 98

Executive Committee

Elmer Torok, *Chairman*
A. W. Harris, Horace Carpenter, C. H. Robinson — *Vice-Chairmen*
J. Mack Tucker, *Secretary-Treasurer*
T. C. Ervin
C. B. Kerns
W. S. Moorehouse
F. R. O'Brien
J. E. Rigby

Junior Group

Francis R. O'Brien, *Chairman*

ERIE

Organized: 1917
Territory: Radius of thirty miles from Erie, Pa.
Place of Meeting: Erie County Court House
Number of Members: 75

Executive Committee

H. J. Joyce, *Chairman*
G. H. Kaemmerling, *Vice-Chairman*
R. R. Blunt, *Secretary*
F. B. Schneider, *Treasurer*
G. W. Bach
F. G. Brinig
D. H. Corey
H. E. Goetz
E. C. Ims
C. I. Rainesale
MacDonald S. Reed
A. F. Wild

FLORIDA

Organized: 1925
Territory: State of Florida
Place of Meeting: Various Cities in State
Local Organization: Florida Engineering Society, Gainesville, Fla.
Number of Members: 82

Executive Committee

V. C. Couchman, *Chairman*
W. E. Drew, *First Vice-Chairman*
John Hunter, *Second Vice-Chairman*
C. F. Whitcomb, Jr., *Secretary-Treasurer*
T. H. Gardner
R. A. Thompson
E. P. Wood
R. R. Roberts, *Student-Chairman*

FORT WAYNE

Organized: 1939
Territory: Counties of LaGrange, Steuben, Noble, DeKalb, Whitley, Allen, Wabash, Huntington, Wells, Adams, Miami, Blackford and Jay in Indiana; Counties of Williams, Defiance, Paulding, Van Wert and Mercer in Ohio
Local Organization: Fort Wayne Engineers' Society
Number of Members: 30

Executive Committee

F. L. Ruoff, *Chairman*
F. T. McInerney, Jr., *Vice-Chairman*
K. K. Cooper, *Secretary*
W. H. Connor, *Treasurer*
N. T. Bourke
W. L. Knauss

GREEN MOUNTAIN

Organized: 1923
Territory: Entire State of Vermont and neighboring and closely related communities of Claremont and Hanover, N.H.
Place of Meeting: Springfield, Windsor, Vt., and Claremont, N.H.
Local Organization: Vermont Engineering Society
Number of Members: 37

Executive Committee

C. H. Adams, *Chairman*
F. T. Gear, *Vice-Chairman*
F. A. Johnson, *Secretary-Treasurer*
E. D. Clark
H. L. Daasch
D. T. Hamilton
J. B. Johnson

GREENVILLE

Organized: As a Branch, 1923; as a Section, 1927
Territory: Radius of sixty miles from Greenville, S.C.
Place of Meeting: Meetings held at Greenville, Clemson College, S.C., Canton, Asheville, and Enka, N.C.
Number of Members: 46

Executive Committee

J. W. Vaughan, Jr., *Chairman*
C. R. Hoey, Jr., *Vice-Chairman*
J. E. Waldrep, *Secretary-Treasurer*
J. A. McPherson
C. F. Mercer
W. P. Tindall
A. H. Vanderhoof
J. C. Whitehurst

HARTFORD

Organized: 1917, as Branch of Conn. Section; reorganized, 1923; New Britain Section merged with Hartford Section, July 1, 1940
Territory: Hartford County except that portion served by New Britain Section
Place of Meeting: Hartford Electric Light Company
Number of Members: 161

Executive Committee

H. F. Ramm, *Chairman*
Henry Michelsen, L. C. Smith } *Vice-Chairmen*
R. D. Keller, *Secretary-Treasurer*
P. W. Bauer
Herbert Burdick
E. P. Herrick
F. O. Hoagland
B. S. Lewis
E. R. Lewis
W. S. Paine
C. H. Richardson
C. C. Stevens
S. J. Teller
H. B. Van Zelm

INLAND EMPIRE

Organized: 1921
Territory: East of Columbia River in State of Washington, and Counties of Okanogan and Benton, and part of Northern Idaho
Place of Meeting: Davenport Hotel, Spokane
Luncheons Wednesdays at 12:00 noon, Davenport Hotel, Spokane
Local Organization: Associated Engineers of Spokane
Number of Members: 20

Executive Committee

J. G. McGivern, *Chairman*
F. W. Candee, *Vice-Chairman*
N. W. Humphrey, *Secretary-Treasurer*
Alexander Lindsay
E. B. Parker
L. J. Pospisil

ITHACA

Organized: 1936
Territory: Radius of thirty miles from Ithaca plus following cities: Binghamton, Corning, Endicott, Geneva, Painted Post
Place of Meeting: Alternately in different cities of Section territory, as announced.
Number of Members: 80

Executive Committee

C. L. Wilder, *Chairman*
S. S. Garrett, *Vice-Chairman*
F. S. Erdman, *Secretary-Treasurer*
D. S. Kimball, Jr.
W. M. Sawdon
M. P. Whitney
N. P. Wickersham

KANSAS CITY

Organized: 1921
Territory: Radius of sixty miles from Kansas City, Mo.
Place of Meeting: University Club
Local Organization: Engineers' Club of Kansas City
Number of Members: 118

Executive Committee

J. R. Stone, *Chairman*
R. V. Sutherland, *Vice-Chairman*
R. P. Hahn, *Secretary*
M. A. Durland, *Treasurer*
F. R. Applegate
C. E. Brown
E. M. Bruzelius
T. C. Cheasley
H. L. Crain
R. S. Tait

Junior Group

H. W. Cockrill, *Chairman*
Jack Weisbein, *Secretary*

LOS ANGELES *

Organized: 1915
Territory: South of southern boundaries of following counties: Monterey, Kings, Tulares, and Inyo, Calif.
Place of Meeting: Barker Bros. Store
Local Organization: Technical Societies of Los Angeles
Luncheon Meetings Thursdays at 12:00 noon at Engineers' Club
Number of Members: 560

Executive Committee

J. Calvin Brown, *Chairman*
E. M. Wagner, *Vice-Chairman*
C. E. McGinnis, *Secretary-Treasurer*
P. L. Armstrong
D. K. Coyle
R. B. Esselman
J. S. Gallagher
R. G. Roshong
C. H. Shattuck
H. S. Spaulding

Junior Group

John H. Hanna, *Junior Chairman*
LeRoy Barrett, *Secretary*
W. L. Parker, *Member at Large*

San Diego Sub-Section

John L. Bacon, *Chairman*
Louis Baldo, *Secretary-Treasurer*

LOUISVILLE

Organized: 1922
Territory: Radius of thirty miles from Louisville, Ky. (includes Lexington, Ky.)
Place of Meeting: University of Louisville, Louisville, Ky.
Local Organization: Engineers and Architects Club
Number of Members: 79

Executive Committee

W. F. Lucas, *Chairman*
H. C. Murphy, *Vice-Chairman*
C. D. Greffe, *Secretary*
J. K. Meyer, *Treasurer*
O. C. Krause
L. S. O'Bannon
J. H. Roman
Melvin Sack

MEMPHIS

Organized: 1923
Territory: Radius of sixty miles from Memphis, Tenn., and eastern half of Arkansas including all the territory east of a line drawn north and south through the western boundary of the city of Little Rock
Number of Members: 23

Executive Committee

R. H. Sogard, *Chairman*
W. H. Roberts, *Vice-Chairman*
J. A. Mollino, Jr., *Secretary-Treasurer*
T. H. Allen
E. J. Kueck

METROPOLITAN

Organized: 1910
Territory: Metropolitan District, New York and New Jersey
Place of Meeting: Engineering Societies Building, 29 West 39th Street, New York, N.Y.
Number of Members: 3,184

Executive Committee

F. D. Carvin, *Chairman*
G. J. Nicastro, *Secretary*
W. H. Larkin, 3rd, *Treasurer*
H. C. R. Carlson, *Chairman of Meetings and Program Committee*
E. J. Billings
P. E. Frank
W. S. Gleeson
P. T. Onderdonk
C. B. Peck
A. R. Mumford, *Ex-Officio*

Junior Group

J. L. Hall, *Chairman*
F. H. Fowler, Jr., *Vice-Chairman*
F. M. Gibson, Jr., *Secretary*
J. S. Hunter
C. C. Kirby
R. L. Robertson
H. D. Strong

MID-CONTINENT

Organized: 1919
Territory: Entire State of Oklahoma; territory in Arkansas not included in Memphis Section; part of Louisiana; and territory in Texas north of the southern boundaries of the counties of Gaines, Dawson, Bordon, Scurry, Fisher, Jones, and Shackelford

* Name changed to Southern California, November 30, 1941.

MID-CONTINENT

(*Continued*)

Place of Meeting: Usually Mayo Hotel, Tulsa, Okla.
Luncheon Meetings with Engineers Club of Tulsa, Mondays at 12:00 noon
Local Organization: Engineers Club of Tulsa
Number of Members: 130

EXECUTIVE COMMITTEE

E. C. BAKER, *Chairman*
A. N. HORNE, *Vice-Chairman*
T. C. WEBB, *Secretary*
E. H. PARKER, *Treasurer*
E. E. AMBROSIUS
R. G. AYERS
D. O. BARRETT
H. B. BERNARD
A. G. BLANCHARD
W. L. DUCKER, JR.
R. L. FEAGLES
W. G. HELTZEL
GWYNNE RAYMOND
W. S. SHERMAN
H. A. WIENECKE

MILWAUKEE

Organized: 1904
Territory: Radius of fifty miles from Milwaukee, Wis.
Place of Meeting: Wisconsin Club
Local Organization: Engineers' Society of Milwaukee
Luncheon Meetings once each month, 3rd Wednesday at Wisconsin Club
Number of Members: 214

EXECUTIVE COMMITTEE

T. F. ESERKALN, *Chairman*
R. J. SMITH, *Secretary-Treasurer*
JAMES BROWER
H. P. DAHLSTRAND
F. H. DORNER, SR.
M. K. DREWRY
WALTER FERRIS
O. A. KISA
J. L. MARTIN
R. C. NEWHOUSE

JUNIOR GROUP

J. L. MARTIN, *Chairman*
J. H. STANEK, *Secretary*
HARRY GUTE
P. J. IMSE
M. E. RUESS
W. T. SAVELAND, JR.
R. C. STRASSMAN

MINNESOTA

Organized: Minneapolis, 1913; St. Paul, 1913; the two Sections merged, 1934
Territory: Entire State of Minnesota
Place of Meeting: Minnesota Union, Univ. of Minnesota
Local Organization: Minneapolis Engineers' Club, Minnesota Federation of Architectural and Engineering Societies
Number of Members: 98

EXECUTIVE COMMITTEE

M. S. WUNDERLICH, *Chairman*
L. C. SPRAGUE, *Vice-Chairman*
N. J. STERNAL, *Secretary-Treasurer*
W. H. ERSKINE
CHARLES FOSTER
C. A. HERRICK
L. G. STRAUB

NEBRASKA

Organized: 1922
Territory: State of Nebraska, and Council Bluffs, Iowa
Place of Meeting: Lincoln and Omaha
Local Organization: Engineers' Clubs of Lincoln and Omaha
Luncheon Meeting every Wednesday noon at the Omaha Engineers' Club—4th Monday Evening at Lincoln
Number of Members: 33

EXECUTIVE COMMITTEE

J. W. KURTZ, *Chairman*
J. W. HANEY, *Vice-Chairman*
G. A. ROGERS, *Secretary-Treasurer*
E. V. PERKINS, *Chairman of Meetings and Program Committee*
J. K. LUDWICKSON
A. A. LUEBS
C. F. MOULTON
W. F. WEILAND

NEW HAVEN

Organized: 1912, reorganized, 1923
Territory: Portions of New Haven and Middlesex Counties, Conn.
Place of Meeting: Mason Laboratory, Yale University
Number of Members: 78

EXECUTIVE COMMITTEE

L. H. VON OHLSEN, *Chairman*
I. T. HOOK, *Vice-Chairman*
F. C. RICHARDSON, *Secretary-Treasurer*
D. L. BACON
A. F. BREITENSTEIN
G. H. EATON
L. C. LICHTY

NEW ORLEANS

Organized: 1916
Territory: All of Louisiana except the northern part allotted to Mid-Continent Section
Place of Meeting: Room 422, St. Charles Hotel
Local Organization: Louisiana Engineering Society
Number of Members: 99

EXECUTIVE COMMITTEE

G. R. HAMMETT, *Chairman*
L. J. CUCULLU, *Vice-Chairman*
A. M. HILL, *Secretary-Treasurer*
E. L. COWAN
L. J. LASSALLE
J. R. ROMBACH, JR.
A. D. STANCLIFF
D. W. STEWART

JUNIOR GROUP

J. R. ROMBACH, JR., *Chairman*
H. W. VOELKEL, *Vice-Chairman*
G. H. SCHMITT, JR., *Secretary*

NORTH TEXAS

Organized: 1922
Territory: All of Texas north of an approximately straight line through Del Rio, Fredericksburg, Georgetown, Cameron, Nacogdoches, and center, including the cities mentioned, and south of north boundaries of the counties of Parmer, Castro, Swisher, Briscoe, Hall, and Childress. Also the City of Texarkana, Ark.
Place of Meeting: Dallas Power & Light Co. Bldg. Auditorium
Local Organization: Technical Club of Dallas
Number of Members: 101

EXECUTIVE COMMITTEE

F. C. JUSTICE, *Chairman*
J. A. NOYES, *Vice-Chairman*
E. J. WACKER, *Secretary-Treasurer*
H. E. CHAMBERS, JR.
H. M. ROBINSON
C. H. SHUMAKER
RAY M. MATSON, *Ex-Officio*

NORWICH

Organized: 1930
Territory: Counties of Tolland, Windham, and New London in Connecticut, and Westerly District in Rhode Island
Place of Meeting: New London Junior College, Pequot Ave., New London, Conn.
Number of Members: 50

EXECUTIVE COMMITTEE

A. W. LUCE, *Chairman*
ROBERT WOSAK, *Secretary-Treasurer*
W. A. MORAIN, *Chairman of the Program Committee*
A. D. ANDRIOLA
W. E. BEANEY
W. E. EDEL
F. E. ENGLISH
DANA YOUNG

ONTARIO

Organized: 1917
Territory: Province of Ontario, Canada
Place of Meeting: Hart House, University of Toronto
Number of Members: 176

EXECUTIVE COMMITTEE

H. H. ANGUS, *Chairman*
ERNEST JONES, *Secretary-Treasurer*
T. H. BLAIR
A. C. BLUE
S. G. CLARKE
C. R. DAVIS
H. G. HILL
T. S. JARDINE
W. G. MCINTOSH
W. E. MICKLETHWAITE
A. A. MOLINE
W. D. SHELDON
FRED'K TRUMAN

JUNIOR GROUP

W. R. TRUSLER, *Chairman*
J. M. VAN WINCKLE, *Secretary-Treasurer*
C. E. BEYNON
J. H. MILLER
F. TAYLOR

OREGON

Organized: 1919
Territory: State of Oregon and that territory in Washington within a radius of thirty miles from Portland, Ore.
Place of Meeting: Usually Public Service Bldg., Portland, Ore.
Local Organization: Oregon Society of Engineers
Number of Members: 45

OREGON

(Continued)

EXECUTIVE COMMITTEE

A. A. OSIPOVICH, *Chairman*
C. GORDON TUPLING, *Vice-Chairman*
E. P. WEISER, *Secretary-Treasurer*
A. J. CHAPUT
A. D. HUGHES
TOM PERRY
R. B. ROWAN

PENINSULA

Organized: 1923
Territory: West of the east boundaries of the following counties: Emmet, Charlevoix, Antrim, Kalkaska, Missaukee, Clare, Isabell, Gratiot, Clinton, Eaton, Calhoun, and Branch, Mich.
Place of Meeting: Grand Rapids, Mich.
Luncheon Meeting Fifth Thursday noon each month
Local Organization: Engineers' Club of Grand Rapids
Number of Members: 50

EXECUTIVE COMMITTEE

JOHN M. GORRIE, *Chairman*
DONALD MCSORLEY, *1st Vice-Chairman*
KENNETH CROWSER, *2nd Vice-Chairman*
CARL J. KUENZEL, *Secretary-Treasurer*
CHARLES BUCK
JANUS R. DE HAMER
GAROLD GEBBEN
CONRAD LOHMANN
GEORGE WARING
CHARLES A. HAMILTON, *Ex-officio*

PHILADELPHIA

Organized: 1912
Territory: Counties of Bucks, Montgomery, Chester, Philadelphia, Delaware, Pa., and the State of Delaware
Place of Meeting: Philadelphia Engineers' Club, 1317 Spruce Street, Philadelphia, Pa.
Local Organization: Philadelphia Engineers' Club
Luncheon Meeting every Thursday noon at 12:30 p.m. at Philadelphia Engineers' Club
Number of Members: 1,002

EXECUTIVE COMMITTEE

J. STANLEY MOREHOUSE, *Chairman*
C. S. GOTWALS, *Vice-Chairman*
L. N. GULICK, *Secretary-Treasurer*
L. P. HYNES
J. J. MCCARTHY
F. W. MILLER

JUNIOR GROUP

E. W. GRISCOM, *Chairman*
W. B. PEGRAM, *Vice-Chairman*
G. G. MARTINSON, *Secretary*
GEORGE FISHER, *Treasurer*
L. N. GULICK, *Senior Adviser*
J. P. CLARK
T. M. POMEROY, JR.
N. R. SEFING
R. D. STAFFER

PIEDMONT—NORTH CAROLINA

Organized: As a Branch, 1923; as a Section 1927; name changed from Charlotte Section to Piedmont—North Carolina, July 1, 1940
Territory: Radius of seventy-five miles from Charlotte, N.C.
Luncheon Meeting every other Monday at 1:00 p.m. at Efirds Department Store Dining Room
Local Organization: Charlotte Engineers Club
Number of Members: 46

EXECUTIVE COMMITTEE

R. W. OLIVE, *Chairman*
A. B. LECLERC, *Vice-Chairman*
W. B. FREEMAN, *Secretary-Treasurer*
B. L. COTTON
C. A. DEWEY
I. W. LEGGETT
R. P. REECE
T. O. SILLS

PITTSBURGH

Organized: 1920
Territory: Counties bounded by and including Beaver, Butler, Venango, Forest, Jefferson, Indiana, Somerset, Fayette, Greene, and Washington, Pa.
Place of Meeting: Engineers' Society of Western Pennsylvania, William Penn Hotel
Local Organization: Engineers' Society of Western Pennsylvania
Number of Members: 423

EXECUTIVE COMMITTEE

L. N. SHARANBERG, *Chairman*
T. J. BARRY, *Vice-Chairman*
C. A. HAHN, *Secretary*
K. F. TRESCHOW, *Treasurer*
S. B. ELY
J. N. EVANS
H. H. HALL
H. L. PARLETTE
R. E. PETERSON
KENNETH SEAVER
J. R. TANNER

PLAINFIELD

Organized: 1921
Territory: Plainfield and territory included between Elizabeth, Bound Brook, Metuchen, and Watchung, N.J.
Place of Meeting: Elizabeth Carteret Hotel, Elizabeth, and Plainfield Masonic Temple, Plainfield
Local Organization: Plainfield Engineers Club, Singer Engineering Society
Number of Members: 170

EXECUTIVE COMMITTEE

G. E. LEAVITT, JR., *Chairman*
F. C. SPENCER, JR., *Vice-Chairman*
E. E. FRANZ, *Secretary*
C. G. HOLMBERG, *Treasurer*
R. C. HECK, JR.
K. A. REEVE

PROVIDENCE

Organized: 1920
Territory: Radius of thirty miles from Providence, R.I.
Place of Meeting: Providence Engineering Society Building, 195 Angell St., Providence, R.I.
Local Organization: Providence Engineering Society
Number of Members: 159

EXECUTIVE COMMITTEE

J. D. ELDERT, *Chairman*
J. D. ROBERTSON, *Vice-Chairman*
R. M. SCOTT, *Secretary-Treasurer*
C. D. BILLMEYER
A. W. CALDER, JR.
J. S. CHAFEE
E. W. HARRINGTON
A. WILLIAM MEYER
P. V. MILLER
A. JOEL WARREN
G. E. WHEELER, JR.

RALEIGH

Organized: As a Branch, 1923; as a Section, 1927
Territory: Radius of sixty miles from Raleigh, N.C.
Places of Meeting: North Carolina State College, Raleigh, N.C.; Duke University, Durham, N.C.
Local Organizations: North Carolina Society of Engineers, Raleigh Engineers Club
Number of Members: 33

EXECUTIVE COMMITTEE

R. B. RICE, *Chairman*
F. B. TURNER, *Vice-Chairman*
R. G. CHAPMAN, *Secretary-Treasurer*
E. G. HOEFER
C. E. KERCHNER
R. M. ROTHGEB
R. S. WILBUR

ROCHESTER

Organized: 1919
Territory: Radius of thirty miles from Rochester, N.Y.
Place of Meeting: Rochester Engineering Society Rooms, Sagamore Hotel
Local Organization: Rochester Engineering Society, Sagamore Hotel
Luncheon Meeting every Tuesday at 12:15 p.m. at Sagamore Hotel
Number of Members: 109

EXECUTIVE COMMITTEE

I. S. BRADLEY, *Chairman*
W. D. WOOD, *Vice-Chairman*
I. G. MCCHESNEY, *Secretary-Treasurer*
K. H. HUBBARD
F. D. PUNNETT
A. E. SCHELL
A. W. SCHUSTER
J. H. SNYDER

ROCK RIVER VALLEY

Organized: 1926
Territory: Thirty miles east and west of Madison, Wis., and extending southward through Rockford, Ill.
Meeting Places: Madison, Wis., Beloit, Wis., and Rockford, Ill.
Local Organization: Rock River Valley Engineering Council
Number of Members: 73

EXECUTIVE COMMITTEE

C. A. JACOBSON, *Chairman*
B. G. ELLIOTT, *Vice-Chairman*
E. L. DAHLUND, *Secretary-Treasurer*
C. L. AVERY
M. W. DUNDORE
D. W. NELSON
F. J. ZIRCHER

ST. JOSEPH VALLEY

Organized: 1929
Territory: Counties of La Porte, Starke, Pulaski, St. Joseph, Marshall, Fulton, Elkhart, and Kosciusko in Indiana, and Cass and Berrien Counties in Michigan
Place of Meeting: South Bend, Ind.
Number of Members: 47

ST. JOSEPH VALLEY

(*Continued*)

Executive Committee

E. J. Williams, *Chairman*
E. T. Cobb, L. E. Waddington, O. E. Zahn — *Vice-Chairmen*
K. W. Knorr, *Secretary*
H. E. Hollensbe
J. A. MacLean
W. D. A. Peaslee
L. E. Waddington
C. C. Wilcox

ST. LOUIS

Organized: 1909
Territory: Radius of thirty miles from St. Louis, Mo.
Place of Meeting: Place varies
Local Organization: Engineers' Club of St. Louis
Number of Members: 205

Executive Committee

R. W. Merkle, *Chairman*
R. C. Thumser, *Vice-Chairman*
Herbert Kuenzel, *Secretary-Treasurer*
C. B. Briscoe, *Chairman of the Program Committee*

SAN FRANCISCO

Organized: 1910
Territory: All territory north of the northern boundaries of the counties of San Luis Obispo, Kern, and San Bernardino
Place of Meeting: Engineers' Club, 206 Sansome St.
Luncheon Meetings, Tuesdays, California Hotel, Oakland; Thursdays, Engineers' Club, San Francisco
Local Organization: San Francisco Engineers' Club
Number of Members: 387

Executive Committee

H. T. Avery, *Chairman*
G. N. Somerville, *Vice-Chairman*
E. H. Cameron, *Secretary-Treasurer*
V. F. Estcourt
R. S. Quick
B. S. Truett
N. F. Ward

Junior Group

V. F. Estcourt, *Chairman*
E. C. Floyd
George L. Sullivan

SAVANNAH

Organized: 1923
Territory: Radius of 125 miles from Savannah in Georgia
Place of Meeting: Savannah Hotel
Local Organization: Engineers' Council of Savannah Chamber of Commerce
Number of Members: 19

Executive Committee

W. L. Mingledorff, *Chairman*
Alex M. Ormond, *Vice-Chairman*
B. J. Sams, *Secretary-Treasurer*
W. H. Artley
A. P. Keisker
L. C. Roesel

SCHENECTADY

Organized: As a Branch, 1919; as a Section, 1927
Territory: Radius of thirty miles from Schenectady, N.Y.
Place of Meeting: Rice Hall
Number of Members: 220

Executive Committee

Carl Schabtach, *Chairman*
E. W. D. Bunke, Alan Howard, E. L. Thearle — *Vice-Chairmen*
Stanford Neal, *Secretary*
L. A. Gore, *Treasurer*
H. E. Bunnell, *Chairman of Program Committee*
R. G. McAndrew
R. S. Neblett
A. R. Stevenson, Jr.

SOUTHERN CALIFORNIA

(See Los Angeles)

SOUTH TEXAS

Organized: 1919
Territory: South Texas and the northern part of the State not included in the North Texas Section territory
Place of Meeting: No fixed meeting place, but all meetings held in Houston
Number of Members: 173

Executive Committee

C. L. Orr, *Chairman*
H. F. Moller, *Vice-Chairman*
J. J. King, *Secretary-Treasurer*
C. W. Crawford
H. E. Degler
V. L. Doughtie
C. A. Hall
H. G. Hiebeler
S. G. Kershner
G. E. Neville
W. B. Preston
J. G. H. Thompson
M. W. Williams

SUSQUEHANNA

Organized: 1927
Territory: Counties of Cumberland, Dauphine, Lebanon, Adams, York, and Lancaster
Place of Meeting: Engineering Society of York, and at Lancaster Twice a Year
Local Organization: Engineering Society of York and Engineers' Society of Pennsylvania, Harrisburg, Pa.
Number of Members: 76

Executive Committee

O. E. Weber, *Chairman*
S. P. Soling, *Vice-Chairman*
E. T. P. Neubauer, *Secretary-Treasurer*
T. K. Breda
Jacob Fisch
M. G. Leeson
M. E. Silberger

SYRACUSE

Organized: 1920
Territory: Radius of thirty miles from Syracuse, N.Y.
Place of meeting: Ball Room of the Onondaga Hotel
Local Organization: The Technology Club of Syracuse
Number of Members: 89

Executive Committee

D. V. Shetland, *Chairman*
M. F. Williams, *Vice-Chairman*
E. A. Failmezger, *Secretary-Treasurer*
L. E. Potter, *Assistant Secretary*
H. T. Avery
C. F. Dietz
E. R. Jefferson
J. W. Linford
E. K. Rhodes
G. I. Vincent

TOLEDO

Organized: 1920
Territory: Radius of thirty miles from Toledo, Ohio
Place of Meeting: University Club, Toledo, Ohio
Local Organization: Affiliated Technical Societies of Toledo
Number of Members: 50

Executive Committee

N. W. Dorman, *Chairman*
H. R. Schutz, *Vice-Chairman*
H. L. Yaryan, Jr., *Secretary-Treasurer*
N. K. Anderson
F. S. Bell
C. W. Frautschi
T. L. Hallenbeck
H. H. Kerr
W. C. Lang
Garland Lufkin
R. H. Marker
W. R. Moran
R. J. Mugfor
L. S. Platou
Joseph Seaman

TRI-CITIES

Organized: 1920
Territory: Radius of thirty miles from Moline, Ill.
Place of Meeting: Rock Island, Ill., Moline, Ill., and Davenport, Iowa
Luncheon Meeting every Wednesday, Davenport Hotel, 12:00 noon
Number of Members: 76

Executive Committee

R. A. Cross, *Chairman*
E. G. Erickson, *Vice-Chairman*
C. A. Carlson, *Secretary-Treasurer*
P. E. Anderson
R. M. Barnes
K. R. Hodges

UTAH

Organized: 1923
Territory: State of Utah
Place of Meeting: University Club, Salt Lake City
Local Organization: Utah Society of Professional Engineers
Number of Members: 33

Executive Committee

G. W. Carter, *Chairman*
G. M. Jones, *Vice-Chairman*
R. D. Baker, *Secretary-Treasurer*
C. B. Bowman
W. J. Cope
W. D. Turpin

VIRGINIA

Organized: 1919
Territory: State of Virginia
Place of Meeting: Richmond, Norfolk, Blacksburg, Charlottesville, Roanoke, University, Petersburg
Local Organization: Central Virginia Engineers Club of Hampton Roads
Number of Members: 200

Executive Committee

G. C. Molleson, *Chairman*
J. B. Jones, *Vice-Chairman*
F. S. Roop, Jr., *Secretary*
W. J. Barber, *Treasurer*
G. L. Bascome
H. C. Hesse
H. R. Hopkins
M. L. Ireland, Jr.
Arthur Roberts, Jr.
H. C. Wintzer

WASHINGTON, D.C.

Organized: 1919
Territory: District of Columbia
Place of Meeting: Auditorium, Potomac Electric Power Co., 10th & E Sts., Washington, D.C.
Number of Members: 337

Executive Committee

W. B. Ensinger, *Chairman*
J. W. Huckert, *Vice-Chairman*
M. A. Mason, *Secretary-Treasurer*
C. E. Miller
T. R. Tate
J. E. Younger
G. F. Jenks, *Ex-Officio*

Junior Group

J. C. Phillips, *Chairman*
H. R. Booth
E. J. H. Lane
R. C. Meleney
F. M. Thuney
R. V. Vittucci

WATERBURY

Organized: 1917, as a Branch; reorganized as a Section, 1923
Territory: Litchfield County and a portion of New Haven County
Place of Meeting: Elton Hotel
Number of Members: 63

Executive Committee

A. L. Alves, *Chairman*
J. R. Hicks, *Vice-Chairman*
H. C. Ashley, *Secretary-Treasurer*
P. E. Peterson
W. C. Schneider
R. W. Shoemaker
R. S. Storrs

WESTERN MASSACHUSETTS

Organized: 1922
Territory: Includes counties of Berkshire, Franklin, Hampden, and Hampshire
Place of Meeting: Highland Hotel, Springfield, Mass.
Local Organization: Engineering Society of Western Massachusetts
Number of Members: 86

Executive Committee

C. Frank Dupee, *Chairman*
R. A. Packard, *Vice-Chairman*
D. A. Bartlett, *Secretary-Treasurer*
A. E. Benson
J. F. Malcolm
E. Lovell Smith

WESTERN WASHINGTON

Organized: 1919
Territory: State of Washington west of Columbia River with exception of territory included in 30-mile radius of Portland, Ore.
Place of Meeting: Engineers' Club, Seattle, Wash.
Local Organization: Seattle Engineers' Club
Luncheon Meetings daily at noon at Engineers' Club, Seattle
Number of Members: 168

Executive Committee

C. B. Shovar, *Chairman*
R. H. G. Edmonds, *Vice-Chairman*
S. Dan Hage, *Secretary-Treasurer*
R. E. Johnson
H. C. Krehbiel, Jr.
J. E. Mylroie

WEST VIRGINIA

Organized: 1925
Territory: State of West Virginia, South of Parallel 39
Place of Meeting: Charleston, W.Va.
Number of Members: 58

Executive Committee

A. H. Cannon, *Chairman*
J. Gilbert Miller, *Vice-Chairman*
J. L. Barker, Jr., *Secretary-Treasurer*
M. S. Bloomsburg
Minott Brooke
C. B. Cochran
H. C. Lewis

WORCESTER

Organized: 1915
Territory: Radius of thirty miles from Worcester, Mass.
Place of Meeting: Sanford Riley Hall, Worcester Poly. Inst.
Local Organization: Worcester Engineering Society
Number of Members: 130

Executive Committee

H. P. Crane, *Chairman*
G. H. MacCullough, *Vice-Chairman*
E. W. Armstrong, *Secretary-Treasurer*
L. R. Ball, *Chairman of Program Committee*
E. K. Allen, Jr.
J. A. Henrickson
F. R. Jones
C. M. McMahon
F. W. Naughton, Jr.
W. M. Wilcox

YOUNGSTOWN

Organized: 1928
Territory: Counties of Trumbull, Mahoning, and Columbiana in Ohio, and Mercer and Lawrence in Pennsylvania
Place of Meeting: Republic Rubber Co. Club Rooms, Albert St., Youngstown, Ohio
Number of Members: 55

Executive Committee

H. W. Smith, *Chairman*
L. A. Kline, *Vice-Chairman*
C. W. Foard, *Secretary-Treasurer*
F. J. Bowers
C. H. Legler
W. J. Longacher
H. E. Melin

STUDENT BRANCHES

ARTICLE B6A, PAR. 20: The Standing Committee on Relations With Colleges shall, under the direction of the Council, have supervision of the Student Branches of the Society and of such work of the Society as aims to further the education of engineers through the colleges and schools of accepted standing.

STANDING COMMITTEE, RELATIONS WITH COLLEGES

A. C. CHICK, *Chairman* (1942)
J. I. YELLOTT (1943)
H. E. DEGLER (1944)
G. L. SULLIVAN (1945)
R. P. REECE (1946)

J. W. HANEY, B. T. MCMINN, R. H. PORTER — *Advisory Members* (1942)

J. L. HALL, *Junior Adviser* (1942)

Communicate with Student Branch through Honorary Chairman

† As of December 15, 1941. * Faculty Adviser.

RESEARCH COMMITTEES

ARTICLE B6A, PAR. 24: The Standing Committee on Research shall, under the direction of the Council, have supervision of the research activities of the Society.

The first Standing Committee on Research was organized in 1909.

STANDING COMMITTEE

W. TRINKS, *Chairman* (1942)
M. D. HERSEY (1943)
HERMAN WEISBERG (1944)
W. R. ELSEY (1945)
J. F. D. SMITH (1946)

LUBRICATION

Appointed October, 1915, to investigate the fundamental problems of lubrication, to formulate results of investigations previously made, and to keep in touch with contemporary research in this field

(Reorganized May, 1936)

G. B. KARELITZ, *Chairman*
S. J. NEEDS, *Secretary*
A. L. BEALL
OSCAR BRIDGEMAN
W. E. CAMPBELL
H. A. EVERETT
A. E. FLOWERS
J. C. GENIESSE
RAYMOND HASKELL
M. D. HERSEY
B. F. HUNTER
C. M. LARSON
F. C. LINN
G. L. NEELY
B. L. NEWKIRK
E. S. PEARCE
ERNEST WOOLER

FLUID METERS

Appointed 1916 to develop the theory of fluid meters of all kinds and to report on the best methods for their installation and use

(Reorganized July, 1926)

R. J. S. PIGOTT, *Chairman*
J. R. CARLTON, *Secretary*
H. S. BEAN
S. R. BEITLER
R. K. BLANCHARD
B. O. BUCKLAND
LOUIS GESS
E. W. JACOBSON
A. J. KERR
T. H. KERR
M. P. O'BRIEN
W. S. PARDOE
L. K. SPINK
R. E. SPRENKLE
E. C. M. STAHL
T. R. WEYMOUTH
M. J. ZUCROW

THERMAL PROPERTIES OF STEAM

Appointed in December, 1921, to direct research on the thermal properties of water-vapor and steam from 0 C to the upper limits of temperature and pressure

(Reorganized April, 1929)

W. L. ABBOTT, *Vice-Chairman*
H. N. DAVIS
H. C. DICKINSON
A. M. GREENE, JR.
R. C. H. HECK
D. S. JACOBUS
MAX JAKOB
J. H. KEENAN
F. G. KEYES
L. S. MARKS
GEO. A. ORROK
R. J. S. PIGOTT
E. L. ROBINSON

STRENGTH OF GEAR TEETH

Appointed in December, 1921, to investigate factors affecting the strength and life of gear teeth

R. E. FLANDERS, *Chairman*
C. H. LOGUE, *Secretary*
EARLE BUCKINGHAM
A. M. GREENE, JR.
C. W. HAM
F. E. MCMULLEN
E. W. MILLER
ERNEST WILDHABER

CUTTING OF METALS

Appointed in September, 1923, to study the problems of metal cutting, including tool materials, tool design, lubrication, cooling, and speeds and feeds

M. F. JUDKINS, *Chairman*
L. N. GULICK, *Secretary*
L. P. ALFORD *
O. W. BOSTON
R. C. DEALE
A. L. DELEEUW
C. M. THOMPSON, JR.

MECHANICAL SPRINGS

Appointed May, 1924, to determine the status of the mechanical-spring art, to promote and conduct necessary and adequate research, and to develop the art to the point of standardization

J. R. TOWNSEND, *Chairman*
C. T. EDGERTON, *Secretary*
R. W. COOK
W. T. DONKIN
RUPEN EKSERGIAN
G. E. HANSEN
BENJAMIN LIEBOWITZ
DAVID LOFTS
R. D. BRIZZOLARA (*Alternate*)
D. J. MCADAM, JR.
L. C. PESKIN
R. E. PETERSON
J. W. ROCKEFELLER, JR.
B. W. ST. CLAIR
M. F. SAYRE
T. R. WEBER
KEITH WILLIAMS
J. K. WOOD
F. P. ZIMMERLI

ELEVATORS

Appointed June, 1924, to study the function and operation of elevator safeties and buffers and their associated mechanisms and to develop methods of test for the approval of elevator safety devices

(Reorganized August, 1940)

D. J. PURINTON, *Chairman*
D. L. LINDQUIST, *Vice-Chairman*
G. H. REPPERT (*Alternate*)
J. A. DICKINSON, *Secretary*
S. W. JONES, *Ex-officio*
E. M. BOUTON
E. B. DAWSON (*Alternate*)
K. A. COLAHAN
G. P. KEOGH
F. PAVLICEK (*Alternate*)
J. J. MATSON
M. B. MCLAUTHLIN
C. R. CALLAWAY (*Alternate*)
W. S. PAINE
J. L. KEANE (*Alternate*)
C. A. PETERS, JR.

EFFECT OF TEMPERATURE ON THE PROPERTIES OF METALS

Appointed December, 1924, as a joint research committee of the A.S.T.M. and the A.S.M.E. to encourage the investigation and accumulation of data on the properties of metals used in the mechanic arts at extremely high and low temperatures

N. L. MOCHEL, *Chairman*
H. J. KERR, *Vice-Chairman*
J. W. BOLTON, *Secretary*
R. H. ABORN
W. H. ARMACOST
A. B. BAGSAR
A. D. BAILEY
F. E. BASH
C. L. CLARK
E. S. DIXON
F. B. FOLEY
J. R. FREEMAN, JR.
H. J. FRENCH
H. W. GILLETT
A. J. HERZIG
G. F. JENKS
J. J. KANTER
C. E. MACQUIGG
E. L. ROBINSON
A. E. WHITE
J. S. WORTH
Director, National Bureau of Standards, U.S. Department of Commerce
Representative of Bureau of Ships, U.S. Navy Department

BOILER FEEDWATER STUDIES

Appointed March, 1925, as a Joint Research Committee of the American Boiler Manufacturers Association, American Railway Engineering Association, American Water Works Association, Edison Electric Institute, the American Society for Testing Materials, and the A.S.M.E. to study methods of analysis and treatment of boiler feedwater for stationary and railroad practice

EXECUTIVE COMMITTEE (Total personnel 41)

C. H. FELLOWS, *Chairman*
R. C. BARDWELL, *Vice-Chairman*
J. B. ROMER, *Secretary*
A. G. CHRISTIE **
R. E. COUGHLIN
B. W. DE GEER
MAX HECHT
H. E. JORDAN
P. B. PLACE
S. T. POWELL
F. N. SPELLER
M. F. STACK

* Deceased, January 2, 1942.
** Official A.S.M.E. representative serving on this committee.

BOILER FEEDWATER STUDIES

(Continued)

G. E. Tate
E. H. Tenney
A. E. White *

CONDENSER TUBES

Appointed May, 1925, to investigate and report on the causes of failure of tubes used in steam condensers and similar heat interchange apparatus

A. E. White, *Chairman*
D. C. Weeks, *Vice-Chairman*
P. A. Bancell
R. A. Bowman
D. K. Crampton
C. A. Crawford
H. M. Cushing
R. E. Dillon
J. R. Freeman, Jr.
V. M. Frost
C. F. Harwood
G. C. Holder
W. C. Holmes
W. B. Price
J. S. Rodgers
M. F. Stack
W. R. Webster
Director, Bureau of Ships, U.S. Navy Department

WORM GEARS

Appointed May, 1927, to investigate certain problems in connection with the action of worm gear drives and to recommend improvements in their design, manufacture, and use

Earle Buckingham, *Chairman*
G. H. Acker
L. R. Buckendale
D. L. Lindquist
A. A. Ross
B. F. Waterman
Representative of Bureau of Ships, U.S. Navy Department

STRENGTH OF VESSELS UNDER EXTERNAL PRESSURE

Appointed June, 1929, to develop reliable design data on the strength of cylindrical and spherical surfaces under external pressure, particularly with reference to jacketed vessels

F. V. Hartman, *Chairman*
W. D. Halsey
M. B. Higgins
A. W. Limont, Jr.
H. E. Saunders
E. E. Shanor
D. B. Wesstrom
F. S. G. Williams
D. F. Windenburg

WIRE ROPE

Appointed April, 1930, to investigate existing rope so that it may be better understood and more effectively used

W. H. Fulweiler, *Chairman*
H. LeR. Brink
D. L. Lindquist
G. W. Martin
A. H. McDougall
B. V. E. Nordberg
W. S. Paine
W. J. Ryan
George Simpson
L. E. Young

CRITICAL PRESSURE STEAM BOILERS

Appointed June, 1931, to study the characteristics of high-pressure forced-circulation steam-generating units

H. L. Solberg, *Chairman*
W. H. Armacost
A. D. Bailey
E. G. Bailey
F. S. Clark
C. H. Fellows
H. J. Kerr
G. A. Orrok
E. C. Petrie
E. L. Robinson
P. W. Thompson

COTTONSEED PROCESSING

Appointed December, 1932, to study the mechanical problems involved in storing, conditioning, and cooking cottonseed meats

W. R. Woolrich, *Chairman*
Homer Barnes
C. E. Garner
J. F. Leahy
R. W. Morton
B. J. Sams
R. B. Taylor

ROLLING OF STEEL (PLASTICITY)

Appointed October, 1938, to study plasticity in the particular field of rolling of steel

A. Nadai, *Chairman*
C. W. MacGregor, *Secretary*
E. C. Bain
C. L. Eksergian
J. H. Hitchcock
G. B. Karelitz
Morris Stone
W. Trinks

FURNACE PERFORMANCE FACTORS

Appointed in October, 1941, to collect and rationalize data on the performance of commercially important furnaces as an aid to design and operation

A. R. Mumford, *Chairman*
Alex D. Bailey
John Blizard
S. P. Burke
O. F. Campbell
W. A. Carter
B. J. Cross
T. B. Drew
F. G. Ely
A. C. Fieldner
J. H. Harlow
H. C. Hottel
E. L. Lindseth
W. H. McAdams
Percy Nicholls
E. B. Powell
A. A. Raymond
R. A. Sherman
Philip Sporn
Herman Weisberg
W. J. Wohlenberg

FORGING OF STEEL SHELLS

Appointed in October, 1941, to study methods of shell manufacture under modern conditions

M. D. Stone, *Chairman*
W. Trinks, *Vice-Chairman*
John Dierbeck
D. W. Fletcher
W. M. Frame
W. N. Howley
A. F. Macconochie
F. C. MacDonald
A. Nadai
George Sachs
A. E. Van Cleve
U. S. Army, Ordnance Department:
Lt.-Col. H. U. Wagner
Major J. H. Frye
Major R. M. Wood
U. S. Navy, Bureau of Ordnance:
Lt.-Com. A. H. Bateman

A.S.M.E. Representatives on Other Research Committees

* Official A.S.M.E. representative serving on this committee.

STANDARDIZATION COMMITTEES

ARTICLE B6A, PAR. 23: The Standing Committee on Standardization shall advise the Council on the dimensional standardization work of the Society, including relations with the American Standards Association.

The first Standing Committee on Standardization was organized in April, 1911

STANDING COMMITTEE

J. E. LOVELY, *Chairman* (1942)
L. T. KNOCKE (1943)
T. E. FRENCH (1944)
W. H. HILL (1945)
J. H. TAYLOR (1946)

STANDARDIZATION AND UNIFICATION OF SCREW THREADS (B1)

* *Joint sponsorship with the Society of Automotive Engineers. Sectional Committee originally organized in June, 1921. Reorganized in February, 1929*

A.S.M.E. Members (Total personnel, 36)

R. E. FLANDERS, *Chairman* †
A. M. HOUSER, *Vice-Chairman* †
EARLE BUCKINGHAM, *Secretary*
E. J. BRYANT
G. S. CASE
T. G. CRAWFORD
H. C. E. MEYER
P. V. MILLER †
W. C. MUELLER
R. H. PERRY
G. T. TRUNDLE

SUBCOMMITTEE CHAIRMEN

Special Subcommittee on Revision of American Standard, P. V. MILLER

No. 1 on Scope, Arrangement, and Editing of American National Standard, R. E. FLANDERS
No. 4 on Acme and Other Similar Threads, Except Gages, EARLE BUCKINGHAM
No. 5 on Screw Thread Gages and Inspection, G. S. CASE
No. 6 on Threading of General Purpose Nuts, J. S. DAVEY
No. 7 on Screw Threads for High Temperature Bolting, W. H. GOURLIE

PIPE THREADS (B2)

* *Joint sponsorship with the American Gas Association. Sectional Committee originally organized in 1913. Reorganized May, 1927*

A.S.M.E. Members (Total personnel, 45)

A. S. MILLER, *Chairman*
C. B. LEPAGE, *Acting Secretary*
A. F. BREITENSTEIN †
E. J. BRYANT
C. S. COLE
E. S. CORNELL, JR.
J. J. CROTTY
A. P. DENTON
J. J. HARMAN
A. M. HOUSER †
P. V. MILLER †
F. H. MOREHEAD
W. C. MORRIS

* Note: All of these standards committees for which the Society is sponsor or joint sponsor, or on which it has representation, are organized under the procedure of the American Standards Association.
† Official A.S.M.E. representative serving on this committee.

S. F. NEWMAN
L. N. SHANNON
FRANK THORNTON, JR.
J. H. WILLIAMS

SUBCOMMITTEE CHAIRMEN

No. 1 on Editing and Gaging, A. M. HOUSER
No. 2 on Taper Pipe Threads, S. B. TERRY
No. 3 on Straight Pipe Threads, A. S. MILLER
No. 4 on Plumbers' Threads, A. F. BREITENSTEIN
No. 5 on Screw Threads for Rigid Steel Conduit, JAMES BARTON
No. 6 on Special Threads for Thin Tubes, C. C. WINTER
Special Subcommittee on Tolerances on Thread Elements, E. J. BRYANT
Special Editing Subcommittee on Taper Pipe Threads, S. B. TERRY
Special Editing Subcommittee on Straight Pipe Threads, P. V. MILLER
Special Subcommittee on Truncation, E. J. BRYANT

BALL AND ROLLER BEARINGS (B3)

* *Joint sponsorship with the Society of Automotive Engineers. Sectional Committee organized December, 1920*

A.S.M.E. Members (Total personnel, 20)

W. P. KENNEDY, *Vice-Chairman* †
D. E. BATESOLE †
L. A. CUMMINGS
O. H. DORER
F. G. HUGHES
G. E. HULSE †
W. L. ILIFF †
L. F. NENNINGER
S. M. WECKSTEIN †
ERNEST WOOLER

ALLOWANCES AND TOLERANCES FOR CYLINDRICAL PARTS AND LIMIT GAGES (B4)

* *Sole sponsorship. Sectional Committee originally organized in June, 1920. Reorganized in September, 1930*

A.S.M.E. Members (Total personnel, 40)

J. E. LOVELY, *Chairman* †
F. E. BANFIELD, JR.
F. S. BLACKALL, JR.
E. J. BRYANT
EARLE BUCKINGHAM †
F. H. COLVIN †
T. G. CRAWFORD
R. E. W. HARRISON
F. O. HOAGLAND
N. F. JACOBI
H. C. E. MEYER
P. V. MILLER
W. C. MUELLER
E. C. PECK †
R. H. PERRY
W. C. SCHOENFELDT
C. C. STEVENS
G. T. TRUNDLE

SUBCOMMITTEE CHAIRMAN

No. 1 on Tolerance Systems, R. E. W. HARRISON

SMALL TOOLS AND MACHINE TOOL ELEMENTS (B5)

* *Joint sponsorship with the National Machine Tool Builders' Association, and the Society of Automotive Engineers. Sectional Committee organized September, 1922*

A.S.M.E. Members (Total personnel, 33)

W. C. MUELLER, *Chairman* †
F. O. HOAGLAND, *Vice-Chairman*
J. B. ARMITAGE
O. W. BOSTON
E. J. BRYANT
EARLE BUCKINGHAM
F. H. COLVIN †
S. A. EINSTEIN
H. E. HARRIS †
JOHN HAYDOCK
J. P. LAUX †
J. E. LOVELY
A. F. MURRAY †
ERIK OBERG
FRANK THORNTON, JR.

TECHNICAL COMMITTEES

EXECUTIVE COMMITTEE

A.S.M.E. Members (Total personnel, 5)

W. C. MUELLER, *Chairman* †
F. O. HOAGLAND, *Vice-Chairman*
H. E. HARRIS †

NO. 1 ON T-SLOTS

A.S.M.E. Members (Total personnel, 6)

ERIK OBERG, *Chairman*
J. B. ARMITAGE
HARRY CADWALLADER, JR.
S. A. EINSTEIN
F. O. HOAGLAND

NO. 2 ON TOOL-POSTS AND TOOL SHANKS

A.S.M.E. Members (Total personnel, 8)

O. W. BOSTON, *Chairman*
F. S. BLACKALL, JR.
GRANGER DAVENPORT
M. E. LANGE

NO. 3 ON MACHINE TAPERS

A.S.M.E. Members (Total personnel, 21)

E. J. BRYANT, *Chairman*
C. B. LEPAGE, *Acting Secretary*
J. B. ARMITAGE
F. S. BLACKALL, JR.
EARLE BUCKINGHAM
F. H. COLVIN †
J. B. DILLARD
(T. F. GITHENS, *Alternate*)
B. P. GRAVES
H. E. HARRIS †
F. O. HOAGLAND
J. H. HORIGAN
L. F. NENNINGER

SUBGROUP CHAIRMEN

Steep Tapers Series, S. MCMULLAN
Revision on Slow Taper Standard, E. J. BRYANT

SMALL TOOLS AND MACHINE TOOL ELEMENTS (B5)

(*Continued*)

No. 4 on Spindle Noses and Collets for Machine Tools

A.S.M.E. Members (Total personnel, 26)

J. E. Lovely, *Chairman*
L. F. Nenninger, *Secretary*
J. B. Armitage
B. P. Graves
F. O. Hoagland
A. M. Johnson
M. E. Lange
J. H. Mansfield
L. D. Spence

SUBGROUP CHAIRMEN

No. 1 on Milling Machines, Small and Medium, J. B. Armitage
No. 2 on Large Milling Machines, F. B. Kampmeier
No. 3 on Grinding Machine Spindles, H. J. Griffing
No. 5 on Drilling Machines and Horizontal Boring Machines, S. McMullan
No. 6 on Turning Machines, Including Automatic Screw Machines, Lathes, Automatic Lathes, Turret Lathes, and Automatic Chucking Machines, J. E. Lovely
No. 8 on Correlation of Counter Proposals for Spindle Noses, J. E. Lovely

No. 5 on Milling Cutters

A.S.M.E. Members (Total personnel, 20)

J. B. Armitage
A. N. Goddard
J. H. Horigan
G. L. Markland, Jr.
E. K. Morgan
Erik Oberg
E. D. Vancil

SUBGROUP CHAIRMEN

No. 1 on Profile Cutters, E. D. Vancil
No. 2 on Keyways, J. B. Armitage
No. 3 on Nomenclature, A. C. Danekind
No. 4 on Limits, J. H. Horigan
No. 5 on Formed Cutters, H. C. Hungerford
No. 6 on Hobs, G. L. Markland, Jr.
No. 7 on Inserted Tooth Cutters, J. B. Armitage

No. 6 on Designations and Working Ranges of Machine Tools

A.S.M.E. Members (Total personnel, 19)

John Haydock, *Chairman*
Earle Buckingham
T. H. Doan, Jr.
B. P. Graves
J. J. McBride
E. R. Smith

No. 7 on Twist Drill Sizes

A.S.M.E. Members (Total personnel, 6)

W. C. Mueller, *Chairman* †
J. H. Horigan

No. 8 on Jig Bushings

A.S.M.E. Member (Total personnel, 8)

J. H. Horigan

SUBGROUP CHAIRMEN

Subgroup on Liner Outer Diameters and Tolerances (to be appointed)

No. 9 on Punch Press Tools

A.S.M.E. Members (Total personnel, 15)

D. H. Chason
N. W. Dorman
E. W. Ernest
H. E. Harris †
D. M. Palmer

No. 10 on Forming Tools and Holders

A.S.M.E. Members (Total personnel, 10)

W. C. Mueller, *Chairman* †
L. D. Spence

No. 11 on Chucks and Chuck Jaws

A.S.M.E. Member (Total personnel, 10)

J. E. Lovely, *Chairman*

SUBGROUP CHAIRMEN

No. 1 on Master Chuck Jaws, J. E. Lovely
No. 2 on Adapters for Air Cylinders, J. E. Lovely

No. 12 on Cut and Ground Thread Taps

(Total personnel, 7)

No. 13 on Splines and Splined Shafts

A.S.M.E. Members (Total personnel, 15)

J. B. Armitage
R. E. W. Harrison
F. O. Hoagland
J. E. Lovely

No. 17 on Nomenclature for Small Tools and Machine Tool Elements

A.S.M.E. Members (Total personnel, 12)

O. W. Boston, *Chairman and Secretary*
F. S. Blackall, Jr.
F. H. Colvin †
H. E. Harris †
F. O. Hoagland

Ex-Officio Members

A. N. Goddard
W. C. Mueller †

No. 19 on Single-Point Cutting Tools

A.S.M.E. Members (Total personnel, 2)

F. H. Colvin, *Chairman* †
O. W. Boston, *Secretary*

No. 20 on Reamers

A.S.M.E. Members (Total personnel, 16)

F. H. Colvin
T. F. Githens
J. H. Horigan
H. E. Wells

SUBGROUP CHAIRMAN

No. 1 on Reamer Proposal, C. M. Pond

No. 21 on Tool-Life Tests for Single-Point Tools

A.S.M.E. Members (Total Personnel, 11)

O. W. Boston, *Chairman*
M. F. Judkins

GEARS (B6)

** Joint sponsorship with the American Gear Manufacturers Association. Sectional Committee organized June, 1921*

A.S.M.E. Members (Total personnel, 27)

Earle Buckingham, *Vice-Chairman* †
C. B. LePage, *Acting Secretary*
G. H. Acker
U. S. Eberhardt
L. H. Fry
C. B. Hamilton, Jr.
D. T. Hamilton
M. R. Hanna
O. A. Leutwiler †
G. L. Markland, Jr.
Carleton Reynell

SUBCOMMITTEE CHAIRMEN

Executive Committee (to be appointed)
No. 1 on Program (to be appointed)
No. 2 on Editing Reports (to be appointed)
No. 3 on Nomenclature, D. T. Hamilton
No. 4 on Tooth Form (Spur Gears), U. S. Eberhardt
No. 5 on Helical Gears, W. P. Schmitter
No. 6 on Worm Gears, T. R. Rideout
No. 7 on Bevel Gears, F. L. Knowles
No. 8 on Materials, C. B. Hamilton, Jr.
No. 9 on Inspection, J. P. Breuer
No. 10 on Horsepower Rating, Earle Buckingham

PIPE FLANGES AND FITTINGS (B16)

** Joint sponsorship with the Heating, Piping and Air Conditioning Contractors National Association, and the Manufacturers Standardization Society of the Valve and Fittings Industry. Sectional Committee organized October, 1921*

A.S.M.E. Members (Total personnel, 50)

C. P. Bliss, *Chairman* †
J. J. Harman, *Secretary*
A. L. Baker
L. W. Benoit †
A. L. Brown
Sabin Crocker
Ferdinand Fink
V. M. Frost
H. E. Haller
J. S. Hess
H. A. Hoffer †
E. L. Hopping
A. M. Houser
C. A. Kelting †
J. R. Kruse (John Blizard, *Alternate*)
M. B. MacNeille
F. H. Morehead
L. S. Morse
Ludwig Skog
J. R. Tanner †
J. H. Taylor
Rowland Tompkins
G. W. Watts
J. H. Williams

SUBCOMMITTEE CHAIRMEN

Executive Committee, C. P. Bliss
No. 1 on Cast Iron Flanges and Flanged Fittings, A. M. Houser
No. 2 on Screwed Fittings, F. H. Morehead
No. 3 on Steel Flanges and Flanged Fittings, C. P. Bliss
No. 4 on Materials and Stresses, A. M. Houser
No. 5 on Face to Face Dimensions of Ferrous Flanged Valves, J. R. Tanner

PIPE FLANGES AND FITTINGS (B16)

(Continued)

No. 5 on Malleable Iron or Steel [illegible] (to be appointed)
No. 7 on Rating of Pipe Fittings (to be appointed)
No. 8 on Marking of Pipe Fittings, [illegible]
No. 9 on [illegible] Openings (to be appointed)

[illegible] (B17)

* [illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

BOLT, NUT, AND RIVET PROPORTIONS (B18)

* Joint sponsorship with the Society of Automotive Engineers. Sectional Committee organized March, 1922

A.S.M.E. Members (Total personnel, [illegible])

W. C. Stewart, Secretary
H. E. Aldrich
[illegible]
G. S. Case
[illegible]
A. M. Houser [illegible]
Herman Koester
[illegible]
[illegible], Alternate

SUBCOMMITTEE CHAIRMEN

No. 1 on Large and Small Rivets (to be appointed)
No. 2 on Wrench-Head Bolts and Nuts (to be appointed)
No. 3 on Slotted Head Proportions (to be appointed)
No. 4 on Track Bolts and Nuts (to be appointed)
No. 5 on Round Unslotted Head Bolts (Carriage Bolts) (to be appointed)
No. 6 on Plow Bolts (to be appointed)
No. 7 on Body Dimensions and Materials (to be appointed)
No. 8 on Nomenclature, G. S. Case
No. 9 on Socket Head Cap and Set Screws, Herman Koester

PLAIN AND LOCK WASHERS (B27)

* Joint sponsorship with the Society of Automotive Engineers. Sectional Committee organized August, 1926

A.S.M.E. Members (Total personnel, [illegible])

[illegible]	[illegible] McBride
[illegible]	[illegible]
[illegible] Lewis	[illegible]
[illegible]	[illegible]

SUBCOMMITTEE CHAIRMEN

No. 1 on Plain Washers, [illegible]
No. 2 on Spring Washers, [illegible]

TRANSMISSION CHAINS AND SPROCKETS (B29)

* Joint sponsorship with the Society of Automotive Engineers, and [illegible]. Sectional Committee organized [illegible]. Reorganized December, [illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

SUBCOMMITTEE CHAIRMEN

No. 1 on Roller Chain Standardization (to be appointed)
No. 2 on [illegible] Chain Standardization, [illegible]

CODE FOR PRESSURE PIPING (B31)

* Sole sponsorship. Sectional Committee organized March, 1926. Reorganized December, 1937

A.S.M.E. Members (Total personnel, [illegible])

[illegible], Chairman
[illegible]
H. E. Morgan
L. S. Morse, Sr.
R. M. Nee
E. W. [illegible]
C. W. [illegible]
[illegible] A. Cerok
A. L. Penniman, Jr.
[illegible] S. Robinson
[illegible] E. Romann
[illegible] Rossheim
[illegible]
[illegible] Smith
[illegible] H. Moss, Alternate
[illegible] Tanner
[illegible] Taylor
[illegible] Vance
[illegible] Whittemore
[illegible] Williams
[illegible] Wolfe

SUBCOMMITTEE CHAIRMEN

[illegible]

[illegible] (B32)

* Joint sponsorship with the Society of Automotive Engineers. [illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

SUBCOMMITTEE CHAIRMEN

[illegible]

[illegible]

[illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

SUBCOMMITTEE CHAIRMEN

[illegible]

WROUGHT IRON AND WROUGHT STEEL PIPE AND TUBING [illegible]

* Joint sponsorship with [illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

WROUGHT IRON AND WROUGHT STEEL PIPE AND TUBING (B36)

[illegible]

[illegible]

SUBCOMMITTEE CHAIRMEN

No. 1 on Plan, Scope, and Editing, [illegible] Morgan
No. 2 on Pipe and Tubing for Low Temperature Service, J. J. Shuman
No. 3 on [illegible] High Temperature Service, [illegible]
No. 4 on [illegible]

[illegible] AND VACUUM GAGES (B40)

Sole sponsorship. Sectional Committee organized [illegible]

A.S.M.E. Members (Total personnel, [illegible])

M. D. Engle, Chairman
[illegible]

SUBCOMMITTEE CHAIRMEN

No. 1 on Plan and Scope, M. D. Engle
No. 2 on Definitions, C. F. [illegible]
No. 3 on Gage Sizes and Mounting Dimensions, [illegible]
No. 4 on Accuracy and Test Methods, C. J. Hodge

STOCK SIZES, SHAPES AND LENGTHS FOR HOT AND COLD FINISHED IRON AND STEEL BARS (B4[illegible])

Sole sponsorship. Sectional Committee organized June, 1930

A.S.M.E. Members (Total personnel, 25)

[illegible]

SUBCOMMITTEE CHAIRMEN

No. 1 on Hot Rolled Steel, Henry Wysor
No. 2 on Cold Finished Steels, L. E. [illegible]
No. 3 on Hot Rolled Iron (to be appointed)

SPECIFICATIONS FOR LEATHER BELTING (B4[illegible])

[illegible] sponsorship. Sectional Committee organized [illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

G. A. Soehren

SUBCOMMITTEE CHAIRMEN

No. 1 on Standard Specifications (to be appointed)
No. 2 on Recommendations for Selection, Care and Installation, G. A. Soehren

MACHINE PINS (B[illegible])

Joint sponsorship with the Society of Automotive Engineers. Sectional Committee organized [illegible]

A.S.M.E. Members (Total personnel, [illegible])

[illegible]

SUBCOMMITTEES

No. 1 on [illegible]
No. 2 on [illegible]

CLASSIFICATION AND DESIGNATION OF SURFACE QUALITIES (B46)

Joint sponsorship with the Society of Automotive Engineers. Sectional Committee organized [illegible]

A.S.M.E. Members (Total personnel, 63)

E. J. Abbott
[illegible]
T. G. Crawford
R. C. Deale
C. S. [illegible]
S. A. [illegible]
R. F. Gagg
W. W. Gilbert
J. J. Harman
R. E. W. Harrison
[illegible]
H. F. Kurtz
F. C. Spencer
[illegible]

SUBCOMMITTEE CHAIRMEN

Executive Committee (to be appointed)
No. 2 on Surfaces Produced by Tools [illegible] (to be appointed)
No. 3 on Coated Surfaces, G. B. Hogaboom
No. 4 on Symbols for Indicating Surface Quality on Drawings, T. G. Crawford
No. 5 on Ways, Means and Apparatus for Measuring Quality of Surface (to be appointed)
No. 7 on Standards for Appearance of Surfaces (to be appointed)

COMBUSTION SPACE FOR SOLID FUELS (B50)

Sole sponsorship. Sectional Committee organized June, 1933

A.S.M.E. Members (Total personnel, 21)

C. E. Bronson, *Chairman*
W. G. Christy
[illegible]
John Van Brunt

SUBCOMMITTEE CHAIRMEN

No. 1 on Purpose and Scope, C. E. Bronson
No. 2 on Combustion and Design, B. M. Guthrie
No. 3 on Warm Air Furnaces, J. H. Manny
No. 4 on Steel Heating Boilers, W. B. Russell
No. 5 on Cast Iron Boilers, J. F. McIntire

SCHEME FOR IDENTIFICATION OF PIPING SYSTEMS (A13)

Joint sponsorship with the National Safety Council. Sectional Committee organized June, 19[illegible]

A.S.M.E. Members (Total personnel, 35)

[illegible]
Crosby Field
[illegible]
H. S. Smith
Frank Thornton, Jr.
[illegible]

SUBCOMMITTEE CHAIRMEN

Executive Committee, A. S. Hebble
Identification by Colors (to be appointed)
Classification, Crosby Field
Identification Markings Other Than Color (to be appointed)
Editing Subcommittee, A. S. Hebble

MINIMUM REQUIREMENTS FOR PLUMBING AND STANDARDIZATION OF PLUMBING EQUIPMENT (A40)

Sole sponsorship. Sectional Committee organized August, 19[illegible]

A.S.M.E. Members (Total personnel, 52)

[illegible]
A. M. Houser
J. W. Martin
(A. H. Morgan, *Alternate*)
W. K. McAfee
Thorndike Saville
W. R. Webster

SUBCOMMITTEE CHAIRMEN

Research Committee on Plumbing (to be appointed)
No. 1 on Minimum Requirements for Plumbing, T. I. Coe
No. 2 on Staple Vitreous China Plumbing Fixtures, H. R. Van Sciver
No. 3 on Staple Porcelain (All Clay) Plumbing Equipment, H. R. Van Sciver
No. 4 on Enameled Sanitary Ware, A. H. Clint, Jr.
No. 5 on Traps, A. R. McGonegal
No. 6 on Brass Plumbing Products (to be appointed)
No. 7 on Brass Fittings for Flared Copper Tubes, F. L. Riggin
No. 8 on Cast Iron Soil [illegible] (to be appointed)

MINIMUM REQUIREMENTS FOR PLUMBING AND STANDARDIZATION OF PLUMBING EQUIPMENT (A40)

(*Continued*)

No. 9 on Gasoline, Oil and Grease Separators (to be appointed)
Joint Committee on Threaded Cast Iron Pipe, F. H. MOREHEAD
No. 11 on Soldered Fittings for Tubing, A. M. HOUSER
No. 12 on Minimum Air Gaps in Plumbing Systems, W. K. MCAFEE

ROLLED THREADS FOR SCREW SHELLS OF ELECTRIC SOCKETS AND LAMP BASES (C44)

Joint sponsorship with the National Electrical Manufacturers Association. Sectional Committee organized March, 1929

A.S.M.E. Members (Total personnel, 16)

E. J. BRYANT †
EARLE BUCKINGHAM †
A. B. MORGAN
E. S. SANDERSON †

LETTER SYMBOLS AND ABBREVIATIONS FOR SCIENCE AND ENGINEERING (Z10)

Joint sponsorship with the American Association for the Advancement of Science, American Institute of Electrical Engineers, American Society of Civil Engineers, and the Society for the Promotion of Engineering Education. Sectional Committee organized January, 1926. Reorganized October, 1935

A.S.M.E. Members (Total personnel, 43)

S. A. MOSS, *Vice-Chairman* †
K. H. CONDIT
R. J. S. PIGOTT †
(S. R. BEITLER, *Alternate*) †
FRANK THORNTON, JR.
E. P. WARNER

SUBCOMMITTEE CHAIRMEN

Executive Committee, H. M. TURNER
Steering Committee, H. M. TURNER
No. 1 on Letter Symbols and Signs for Mathematics, A. A. BENNETT
No. 2 on Symbols for Hydraulics, J. C. STEVENS
No. 3 on Symbols for Mechanics, R. E. PETERSON
No. 4 on Symbols for Structural Analysis, ALBERT HAERTLEIN
No. 5 on Symbols for Heat and Thermodynamics, S. A. MOSS
No. 6 on Symbols for Photometry, E. C. CRITTENDEN
No. 7 on Aeronautical Symbols, G. W. LEWIS
No. 8 on Symbols for Electric and Magnetic Quantities (to be appointed)
No. 9 on Symbols for Radio, H. M. TURNER
No. 10 on Symbols for Physics, H. K. HUGHES
No. 11 on Abbreviations for Engineering and Scientific Terms, G. A. STETSON

DRAWINGS AND DRAFTING ROOM PRACTICE (Z14)

Joint sponsorship with the Society for the Promotion of Engineering Education. Sectional Committee organized July, 1926

A.S.M.E. Members (Total personnel, 51)

T. E. FRENCH, *Chairman*
H. P. FREAR
F. DER. FURMAN
A. C. HARPER
E. R. HILL
A. M. HOUSER
ALFRED IDDLES
SAMUEL KETCHUM †

E. S. SMITH †

SUBCOMMITTEE CHAIRMAN

Subcommittee on Revision, F. G. HIGBEE

GRAPHIC PRESENTATION (Z15)

*** *Sole sponsorship. Sectional Committee organized November, 1926***

A.S.M.E. Members (Total personnel, 31)

G. E. HAGEMANN, *Secretary* †
C. M. BIGELOW
WALLACE CLARK
T. E. FRENCH
D. B. PORTER †

SUBCOMMITTEE CHAIRMEN

No. 1 on Plan and Scope (to be appointed)
No. 2 on Terminology (to be appointed)
No. 3 on Preferred Practice for Time Series Charts, A. H. RICHARDSON
No. 4 on Engineering and Scientific Graphs, W. A. SHEWHART

SPEEDS OF MACHINERY (Z18)

*** *Sole sponsorship. Sectional Committee organized May, 1928***

A.S.M.E. Members (Total personnel, 30)

C. M. BIGELOW †
J. F. DAGGETT
R. C. DEALE †
PAUL DISERENS
F. S. ENGLISH
P. G. RHOADS
F. C. SPENCER

SUBCOMMITTEE CHAIRMEN

No. 1 on Plan and Scope, A. E. HALL
No. 2 on Questionnaire and Canvass to Industry, F. S. ENGLISH
No. 3—Special Reviewing Committee (to be appointed)

GRAPHICAL SYMBOLS AND ABBREVIATIONS FOR USE IN DRAWINGS (Z32)

Joint sponsorship with American Institute of Electrical Engineers. Sectional Committee organized April, 1936

A.S.M.E. Members (Total personnel, 51)

E. E. ASHLEY
J. M. BARNES
T. H. CHILTON
T. E. FRENCH †
G. F. HABACH
D. T. HAMILTON

POWER TEST CODES COMMITTEES

ARTICLE B6A, PAR. 27: The Standing Committee on Power Test Codes shall, under the direction of the Council, have supervision of all the activities of the Society in connection with the A.S.M.E. Power Test Codes, including the interpretation of such codes.

The first Standing Committee on Power Test Codes was organized in December, 1918, to revise and extend the Power Test Codes which had been formulated by various technical committees appointed to develop particular codes. This work began in 1884.

STANDING COMMITTEE

FRANCIS HODGKINSON, *Chairman* (1944)

THE WOMAN'S AUXILIARY TO THE A.S.M.E.

The Woman's Auxiliary to the A.S.M.E. was organized on May 10, 1923, and its Constitution and By-Laws was approved by the Council of the A.S.M.E. on October 27, 1924. The objects of the Auxiliary are to render service to all that pertains to the interest of the profession of mechanical engineering; to cooperate with any committees of the A.S.M.E.; and to assist the sons and daughters of the members of the Society or worthy students of mechanical engineering in obtaining scholarships; and to promote any other objects consistent with the aims or objects of the A.S.M.E.

OFFICERS

President, Mrs. F. M. Gibson
First Vice-President, Mrs. E. C. M. Stahl
Second Vice-President, Mrs. C. M. Sames
Third Vice-President, Mrs. R. F. Gagg
Fourth Vice-President, Mrs. E. F. Zeiner
Fifth Vice-President, Mrs. S. F. Duncan
Recording Secretary, Mrs. P. E. Frank
Corresponding Secretary, Mrs. A. R. Cullimore
Treasurer, Mrs. A. H. Morgan

STANDING COMMITTEE CHAIRMEN

Student Loan, Mrs. R. F. Gagg
Membership, Mrs. G. E. Hagemann
Calvin W. Rice Scholarship, Mrs. J. A. Brooks
Custodian, Miss Burtie Haar

COUNCIL REPRESENTATIVES

A. G. Christie
Warren H. McBryde

OFFICERS OF LOCAL SECTIONS

Cleveland

Chairman, Mrs. T. F. Githens

Los Angeles

Chairman, Mrs. S. F. Duncan

Metropolitan

Chairman, Mrs. J. Noble Landis
First Vice-Chairman, Mrs. Calvin W. Rice
Second Vice-Chairman, Mrs. C. H. Young
Third Vice-Chairman, Mrs. Earl Smith
Recording Secretary, Mrs. C. F. Kayan
Corresponding Secretary, Miss Burtie Haar
Treasurer, Mrs. C. E. Gus

Philadelphia

Chairman, Mrs. E. F. Zeiner

AWARDS

The following paragraphs deal with the medals, awards, scholarships, and loan funds which come within the jurisdiction of the A.S.M.E. Other awards available to Student Members are listed in *Mechanical Engineering,* February, 1938, page 183. The Society also participates with other engineering societies in a number of joint awards. Further details concerning all the awards will be found in a series of articles beginning in the October, 1938, issue of *Mechanical Engineering.*

Honorary Membership, to which persons of acknowledged professional eminence are elected by unanimous vote of Council under the provisions of the By-Laws and Rules. A list of honorary members is given on page RI-42.

Life Membership, which may be conferred by the Council for distinguished service to the Society; or secured by a member by payment for an annuity in accordance with the provisions of the By-Laws.

A.S.M.E. Medal, established by the Society in 1920 to be presented, together with an engraved certificate, for distinguished service in engineering and science. May be awarded for general service in science having possible application in engineering.

Holley Medal, instituted and endowed in 1924 by George I. Rockwood, Past Vice-President of the Society, to be bestowed, together with an engraved certificate, for some great and unique act of genius of engineering nature that has accomplished a great and timely public benefit.

Worcester Reed Warner Medal, provision for which was made in the will of Worcester Reed Warner, Honorary Member of the Society, is a gold medal to be bestowed, together with an engraved certificate, on the author of the most worthy paper received, dealing with progressive ideas in mechanical engineering or efficiency in management.

Melville Medal, established in 1914 by the bequest of Rear-Admiral George W. Melville, Honorary Member and Past-President of the Society, to be presented, together with an engraved certificate, for an original paper or thesis of exceptional merit, presented to the Society for discussion and publication, to encourage excellence in papers. The medal may be presented annually.

Spirit of St. Louis Medal, established by an endowment fund created in 1929 by citizens of St. Louis, Mo., to be awarded for meritorious service in the advancement of aeronautics. This medal will be awarded at the discretion of the Council of the Society at approximately three-year periods upon the recommendation of its Board of Honors and Awards.

Spirit of St. Louis Junior Award, established in 1938 by an endowment fund created by the General Committee for the 1935 Aeronautic Meeting in St. Louis; a cash award of $50, made every three years, for the best paper on an aeronautic subject presented at any A.S.M.E. meeting during the three-year period either personally by the author (a Junior Member of the Society under thirty years of age) or by a Junior Member designated by him, and submitted to the Committee on Medals within a reasonable period (to be determined by the Committee) after its initial presentation.

Pi Tau Sigma Medal Award, established in 1938, endowed by Pi Tau Sigma, the national honorary mechanical engineering fraternity, to be presented annually, together with an engraved certificate, to the young mechanical engineer for outstanding achievement in his profession within the ten years after graduation from a regular four-year mechanical engineering course of a recognized American college or university. Any mechanical engineering graduate, not more than thirty-five years of age, whose achievement has been all or in part in any field including industrial, educational, political, research, civic, etc., is eligible.

Junior Award, annual cash award of $50, established in 1914, from a fund created by Henry Hess, Past Vice-President of the Society, to be presented, together with an engraved certificate, for the best paper or thesis submitted by a Junior Member.

Charles T. Main Award, annual cash award of $150, established in 1919 from a fund created by Charles T. Main, Past-President of the Society, to be awarded, together with an engraved certificate, to a Student Member of the Society, for the best paper within the general subject of the influence of the profession upon public life. The exact subject is assigned by the Board of Honors and Awards, subject to the approval of the Council, and is announced each year through the Honorary Chairman of the Student Branches.

Student Awards, two annual cash awards of $25 each, established in 1914, from a fund created by Henry Hess, Past Vice-President of the Society, to be presented, together with engraved certificates, for the best papers or theses submitted by Student Members. The awards for 1932 and subsequent years have been given, one for undergraduate and the other for postgraduate work.

SCHOLARSHIPS AND LOAN FUNDS

Max Toltz: Loan Fund of $15,000 established by Major Max Toltz, former member of the Council of the Society, the income to be used for assistance to Student Members.

John R. Freeman: Fund of $25,000 established in 1926 by John R. Freeman, Past-President of the Society, the income to be used for travel scholarships and research.

Woman's Auxiliary: Scholarship or Fellowship offered by the Woman's Auxiliary to the Society to assist sons and daughters of members or worthy students of mechanical engineering.

RECIPIENTS OF AWARDS

The names of the recipients of the different awards to date are given in the following lists, together with the dates of presentation, and the services or papers for which the awards were made. There were no awards for the years not listed.

A.S.M.E. Medal

1921 Hjalmar Gotfried Carlson, in recognition of the services rendered the Government because of his invention and part in the production of 20,000,000 Mark III drawn steel booster casings used principally as a component of 75-mm high explosive shells, but also used extensively in gas shells and bombs

1922 Frederick Arthur Halsey, for his paper describing the premium system of wage payments presented before the Society at the Providence Meeting in 1891, as the adoption of the methods there proposed has had a profound effect toward harmonizing the relations of worker and employer

1923 John Ripley Freeman, for his eminent service in engineering and manufacturing by his meritorious work in fire prevention and the preservation of property

1926 R. A. Millikan, in recognition of his contributions to science and engineering

1927 Wilfred Lewis, for his contributions to the design and construction of gear teeth

1928 Julian Kennedy, for his services and contributions to the iron and steel industry

1929 William LeRoy Emmet, for his contributions in the development of the steam turbine, electric propulsion of ships, and other power-generating apparatus

1931 Albert Kingsbury, for his research and development work in the field of lubrication

1933 Ambrose Swasey, for his contributions to the advancement of the engineering profession and for his part in the development of the turret lathe and the astronomical telescope

1934 Willis H. Carrier, in recognition of his research and development work in air-conditioning

1935 Charles T. Main, for distinguished achievements in the textile and other industries, in engineering education, and for eminent service to the engineering profession

1936 Edward Bausch, for meritorious mechanical developments in the field of optics

1937 Edward P. Bullard, for outstanding leadership in the development of station-type machine tools

1938 Stephen J. Pigott, for outstanding leadership in marine propulsion and construction

1939 James E. Gleason, for service to the cause of safer and better transportation

1940 Charles F. Kettering, for outstanding inventions and research

1941 Theodor von Kármán, for his brilliance as a teacher, his researches in elasticity and many fields of physics and mechanics, and his distinguished leadership in the fields of aerodynamics and aircraft design.

Holley Medal

1924 Hjalmar Gotfried Carlson, for his inventions and processes which made possible the timely production of drawn steel booster casings for artillery ammunition, thereby aiding victory in the World War (diploma in recognition of achievements presented in 1921)
1927 Elmer Ambrose Sperry, for achievements and inventions that have advanced the naval arts, including the gyroscope that has freed navigation from the dangers of the fluctuating magnetic compass
1929 Baron Chuzaburo Shiba, for his contributions to knowledge through fundamental research, including the field of aerodynamics, by the development of ultra-rapid kinematographic methods
1934 Irving Langmuir, for his contributions to science and engineering, including the development of gas-filled incandescent lamps, thoriated filament for thermionic emission, atomic hydrogen welding, phase control operation of the thyratron tube, and fundamental research in oil films
1936 Henry Ford, for revolutionary influence through invention and practice on transportation and on mass production methods in manufacturing
1937 Frederick G. Cottrell, for preeminent public service—the invention of electric precipitation—advancement of the science of gas liquefaction—gifts for engineering research
1938 Francis Hodgkinson, for meritorious services in the development of the steam turbine
1939 Carl E. Johansson, in recognition of his pioneer work in the development of basic measuring gages
1940 Edwin Howard Armstrong, for his leadership in the field of radio communication
1941 John C. Garand, for the invention and development of the semi-automatic rifle, which has been adopted by the U.S. Army as the U.S. Rifle, Caliber .30, M1, an outstanding contribution to our national defense.

Worcester Reed Warner Medal

1933 Dexter S. Kimball, for his contributions to efficiency in management as exemplified by his recently revised "Principles of Industrial Organization" and by his many articles, engineering society papers, and public addresses
1934 Ralph E. Flanders, for his contributions to a better understanding of the relationship of the engineer to economic problems and social trends as exemplified by the many papers which he has presented
1935 Stephen Timoshenko, for his contributions to the theory of the design of elastic structures and the treatment of dynamics of moving machinery
1936 Charles M. Allen, for his early and continued hydraulic laboratory work and for the permanent value of the papers on his development of methods of testing large hydraulic turbine installations
1937 Clarence F. Hirshfeld, for his research and contributions to the theory and practice of heat-power engineering as exemplified by books and papers
1938 Lawford H. Fry, for contributions relating to improved locomotive boiler design and utilization of better materials in railway equipment
1939 Rupen Eksergian, for influential papers of permanent value in A.S.M.E. Transactions
1940 William Benjamin Gregory, for distinguished work in hydraulic engineering, which has been the basis for many engineering papers
1941 Richard Vynne Southwell, for his many distinguished services to engineering and science through papers and publications in many fields, including aeronautics, theory of structures, elasticity, and hydrodynamics.

Melville Medal

1927 Leon P. Alford, "Laws of Manufacturing Management"
1929 Joseph W. Roe, "Principles of Jig and Fixture Practice"
1930 Herman Diederichs and William D. Pomeroy, "The Occurrence and Elimination of Surge or Oscillating Pressure in Discharge Lines From Reciprocating Pumps"
1931 Arthur E. Grunert, "Comparative Performance of a Pulverized-Coal-Fired Boiler Using Bin System and Unit System of Firing"
1932 Alexey J. Stepanoff, "Leakage Loss and Axial Thrust in Centrifugal Pumps"
1933 William E. Caldwell, "Characteristics of Large Hell Gate Direct-Fired Boiler Units"
1935 Oscar R. Wikander, "Draft-Gear Action in Long Trains"
1936 H. A. Stevens Howarth, "The Loading and Friction of Thrust and Journal Bearings With Perfect Lubrication"
1937 Alfred J. Büchi, "Supercharging of Internal-Combustion Engines With Blowers Driven by Exhaust-Gas Turbines"
1938 Alphonse I. Lipetz, "Air Resistance of Railroad Equipment"
1939 Lester M. Goldsmith, for his paper, "High-Pressure High-Temperature Turbine-Electric Steamship *J. W. Van Dyke*"
1940 Carl A. W. Brandt, for his paper, "The Locomotive Boiler"
1941 Roger V. Terry, for his paper "Development of the Automatic Adjustable-Blade-Type Propeller Turbine."

Spirit of Saint Louis Medal

1929 Daniel Guggenheim, founder of the Guggenheim Fund for the Promotion of Aeronautics
1932 Paul Litchfield, for his work in encouraging and sponsoring airship design and construction in this country
1935 Will Rogers, for his splendid, constructive, and unselfish work in the achievement of aviation, and the building up of public confidence in aviation through his articles in the press, over the radio, and from the speaker's platform
1938 James H. Doolittle, for meritorious service in the advancement of aeronautics
1941 John E. Younger, for notable contributions to the science of airplane design, particularly in the conception, analysis, and supervision of the development of the fundamental design principles, requirements, and criteria which first assured the success of the pressure-cabin type of high-altitude airplane.

Spirit of Saint Louis Junior Award

1941 Wilbur W. Reaser, for his paper, "Calculation of the Heat Loss from an Airplane Cabin."

Pi Tau Sigma Medal

1938 Wilfrid E. Johnson, for his development work in the field of refrigeration
1939 John I. Yellott, Jr., in recognition of significant achievements in steam-flow research and engineering education; also contributions on "Supersaturated Steam" and "Condensation of Flowing Steam in Diverging Nozzles"
1940 George A. Hawkins, for significant achievements in high-pressure steam research and engineering education
1941 R. Hosmer Norris, for outstanding achievement in mechanical engineering, particularly in the heat-transfer field.

Junior Award

1915 Ernest O. Hickstein, "Flow of Air Through Thin Plate Orifices"
1916 L. M. McMillan, "The Heat Insulating Properties of Commercial Steam-Pipe Coverings"
1919 E. D. Whalen, "Properties of Airplane Fabrics"
1921 S. Logan Kerr, "Moody Ejector Turbine"
1922 R. H. Heilman, "Heat Losses From Bare and Covered Wrought-Iron Pipe at Temperatures up to 800 Degrees Fahrenheit"
F. L. Kallam, "Preliminary Report on the Investigation of the Thermal Conductivity of Liquids"
1923 S. S. Sanford and Sabin Crocker, "The Elasticity of Pipe Bends"
1924 R. H. Heilman, "Heat Losses Through Insulating Material"
1925 Gilbert S. Schaller, "An Investigation of Seattle as a Location for a Synthetic Foundry Industry"
1927 William M. Frame, "Stresses Occurring in the Walls of an Elliptical Tank Subjected to Low Internal Pressure"
1928 M. D. Aisenstein, "A New Method of Separating the Hydraulic Losses in a Centrifugal Pump"
1929 Arthur M. Wahl, "Stresses in Heavy, Closely Coiled Helical Springs"
1930 Ed Sinclair Smith, "Quantity-Rate Fluid Meters"
1931 M. K. Drewry, "Radiant-Superheater Developments"
1932 Edmond M. Wagner, "Frictional Resistance of a Cylinder Rotating in a Viscous Fluid Within a Coaxial Cylinder"
1933 Townsend Tinker, "Surface Condenser Design and Operating Characteristics"
1934 John I. Yellott, Jr., "Supersaturated Steam"
1935 Stanley J. Mikina, "Effect of Skewing and Pole Spacing on Magnetic Noise in Electrical Machinery"

1936 Harwood F. Mullikan, Jr., "Evaluation of Effective Radiant Heating Surface and Application of the Stefan-Boltzman Law to Heat Absorption in Boiler Furnaces"
1937 Leslie J. Hooper, "American Hydraulic-Laboratory Practice"
1938 Arthur C. Stern, "Separation and Emission of Cinders and Fly Ash"
1940 Robert E. Newton, for his paper, "A Photoelastic Study of Stresses in Rotary Disks"
1941 John T. Rettaliata, for his paper, "The Combustion Gas Turbine."

Charles T. Main Award

1925 Clement R. Brown, Catholic University of America. Subject: "The Influence of the Locomotive on the Unity of the United States"
1926 W. C. Saylor, Johns Hopkins University. Subject: "The Effect of the Cotton Gin Upon the History of the United States During Its First Seventy Years"
1927 No Award. Subject: "Scientific Management and Its Effect Upon the Industries"
1928 Robert M. Meyer, Newark College of Engineering. Subject: "Scientific Management and Its Effect Upon Manufacturing"
1929 No Award. Subject: "The Influence of Engineering on Farm Production"
1930 Jules Podnossoff, Polytechnic Institute of Brooklyn. Subject: "The Value of the Safety Movement in the Industries"
1931 Robert E. Klise, University of Michigan. Subject: "Interchangeability—Its Development and Significance in Industry"
1932 Marshall Anderson, University of Michigan. Subject: "Apprenticeship and Vocational Training"
1933 George D. Wilkinson, Jr., Newark College of Engineering Subject: "Progress in the Prevention of Smoke and Atmospheric Pollution"
1934 Philip P. Self, Colorado State College. Subject: "Air Conditioning—Its Practicability and Relation to Public Welfare"
1935 G. Lowell Williams, Lafayette College. Subject: "Coordinated Transportation—An Economic Comparison of Railroad, Bus, Truck, Water, and Air Transportation for Long and Short Haul"
1936 No Award. Subject: "Development in the Generation and Distribution of Power and Their Effect Upon the Consumer"
1937 Allan P. Stern, Case School of Applied Science. Subject: "The Influence of the Introduction of Labor Saving Machinery Upon Employment in the United States"
1938 Edward W. Connolly, University of Detroit. Subject: "Economic Limitations in Engineering Design, With Concrete Examples"
1939 James R. Bright, Lehigh University. Subject: "The Economics of Investment in New Manufacturing Equipment—With Concrete Cases"
1940 Frank De Pould, Case School of Applied Science. Subject: "What Has Been the Effect of Technological Advance on Employment?"
1941 John J. Balun, University of Detroit. Subject: "The Need and Possibilities of Participation by Engineers in Public Affairs."

Student Award

1916 Boynton M. Green, Stanford University, "Bearing Lubrication"
Howard E. Stevens, Rensselaer Polytechnic Institute, "An Investigation of the Dynamic Pressure on Submerged Flat Plates"
M. Adam, Louisiana State University, "The Adaptability of the Internal Combustion Engine to Sugar Factories and Estates"
1917 H. R. Hammond and C. W. Holmberg, The Pennsylvania State College, "Study of Surface Resistance With Glass as the Transmission Medium"
1919 C. F. Leh and F. G. Hampton, Stanford University, "An Experimental Investigation of Steel Belting"
W. E. Helmick, Stanford University, "An Experimental Investigation of Steel Belting"
1920 Howard G. Allen, Cornell University, "Wire Stitching Through Paper"
1921 Karl H. White, University of Kansas, "Forces in Rotary Motors"
Richard H. Morris and Albert J. R. Houston, University of California, "A Report Upon an Investigation of the Herschel Type of Improved Weir"
1923 Charles F. Olmstead, University of Minnesota, "Oil Burning for Domestic Heating"
H. E. Doolittle, University of California, "The Integrating Gate: A. Device for Gaging in Open Channels"
1924 George Stuart Clark, Stanford University, "Two Methods Used for the Determination of the Gasoline Content of Absorption Oils in Absorption Plants"
L. J. Franklin and Charles H. Smith, Stanford University, "The Effect of Inaccuracy of Spacing on the Strength of Gear Teeth"
1925 Harry Pease Cox, Jr., Rensselaer Polytechnic Institute, "A Study of the Effect of End Shape on the Towing Resistance of a Barge Model"
W. S. Montgomery, Jr., and E. Ray Enders, Jr., Pennsylvania State College, "Some Attempts to Measure the Drawing Properties of Metals"
1926 R. E. Peterson, University of Illinois, "An Investigation of Stress Concentration by Means of Plaster of Paris Specimens"
Cecil G. Heard, University of Toronto, "Pressure Distribution Over U.S.A. 27 Aerofoil With Square Wing Tips—Model Tests"
1927 Alfred H. Marshall, Princeton University, "Evaporative Cooling"
Roger Irwin Eby, University of Washington, "Measurement of the Angular Displacement of Flywheels"
1928 Clarence C. Franck, Johns Hopkins University, "Condition Curves and Reheat Factors for Steam Turbines"
1929 Frank Vernon Bistrom, University of Washington, "An Investigation of a Rotary Pump"
William Wallace White, University of Washington, "An Investigation of a Rotary Pump"
1930 Gerard Eden Claussen, Polytechnic Institute of Brooklyn, "High-Temperature Oxidation of Steel"
Harold L. Adams and Richard L. Stith, University of Washington, "A Wind Tunnel for Undergraduate Laboratory Experiments"
1931 Jules Podnossoff, Polytechnic Institute of Brooklyn, "Pressure and Energy Distribution in Multi-Stage Steam Turbines Operating Under Varying Conditions"
1932 H. E. Foster, Jr., University of Tennessee, "Factors Affecting Spray Pond Design" (Undergraduate Award)
William A. Mason, Stanford University, "An Experimental Investigation of the Flame Propagation in Internal-Combustion Engines" (Postgraduate Award)
1933 Hugo V. Cordiano, Polytechnic Institute of Brooklyn, "Thermal Analysis of Lithium-Magnesium System of Alloys" (Undergraduate Award)
James A. Ostrand, Jr., Princeton University, "Sudden Enlargement in the Open Channel" (Postgraduate Award)
1934 H. Reynolds Hudson, Georgia School of Technology, "Dynamic Balance and Functional Utility Applied to Automotive Design" (Undergraduate Award)
1935 Charles P. Bacha, Rutgers University, "The Behavior of Metals Subjected to Combined Stress" (Postgraduate Award)
Robert W. Beal, Oregon State College, "Do Lubricating Oils Wear Out?" (Undergraduate Award)
1936 Leon B. Stinson, Oklahoma Agricultural and Mechanical College, "Polymerized Motor Fuels; Their Economic Significance" (Undergraduate Award)
DeWitt D. Barlow, Jr., Princeton University, "The Critical Speeds of Lateral Vibrations of Shafts with Gyroscopic Effects" (Postgraduate Award)
1937 Gino J. Marinelli, Rensselaer Polytechnic Institute, "Investigation of the Towing Resistance of a Model Submarine Hull" (Undergraduate Award)
1938 Marshall C. Long, Princeton University, "An Investigation Into the Angular Characteristics of an Adjustable Blade Current Meter" (Postgraduate Award)
Donald C. McSorley, Michigan State College, "Humidity Insulation" (Undergraduate Award)

39 David T. James, Michigan State College, "Bells—Concerning Their Tones" (Undergraduate Award)

940 George W. Shepherd, Jr., Princeton University, "An Automatic Mechanical Control for Synchronizing Prime Movers" (Postgraduate Award)

Edward D. Rowan, Oregon State College, "Powder Metallurgy (Undergraduate Award)

[illegible] G. Walker Gilmer, III, University of Florida, "Center of Pressure Characteristics of a Marconi Yacht Sail" (Undergraduate Award).

Freeman Travel Scholarship

1927	Herbert N. Eaton
1928	Blake R. Van Leer
1929	Robert T. Knapp
1931	Reginald Whitaker
1932	G. Ross Lord
1933, 1934	H. J. Casey
1935, 1936	Victor L. Streeter

HONORARY MEMBERS

HONORARY MEMBERS IN PERPETUITY

ALEXANDER LYMAN HOLLEY, Founder of the Society. Died 1882.

JOHN EDSON SWEET, Founder of the Society. Died 1916.

HENRY ROSSITER WORTHINGTON, Founder of the Society. Died 1880.

DECEASED HONORARY MEMBERS

	Elected	Died
Leon Pratt Alford	1941	1942
Horatio Allen	1880	1889
Lorenzo Allievi	1937	1941
Sir William Arrol	1905	1913
Sir John Audley Frederick Aspinall	1911	1937
William Wallace Atterbury	1925	1935
Sir Benjamin Baker	1886	1907
Johann Bauschinger	1884	1893
Sir Henry Bessemer	1891	1898
Sir Frederick Joseph Bramwell	1884	1903
John Alfred Brashear	1908	1920
Gustave Canet	1900	1908

Dexter Simpson Kimball	1939
Albert Kingsbury	1940
Charles Thomas Main	1939
George A. Orrok	1936
Grande Ufficiale Ing. Pio Perrone	1920
Edwin Jay Prindle	1939
Rear Admiral Samuel Murray Robinson	1941
James A. Seymour	1940
Aurel Stodola	1941
William H. Tschappat	1938
Henry Hague Vaughan	1939
Right Honorable Lord Weir	1920
Major General Charles Macon Wesson	1941
Orville Wright	1918

PAST-PRESIDENTS

A list of past vice-presidents, managers, treasurers, and secretaries will be found in the 1930 Record and Index, pages 10-12. Dates in parentheses denote year of death.

ALEXANDER LYMAN HOLLEY, *Chairman of the Preliminary Meeting for Organization of The American Society of Mechanical Engineers* (1882)

1880–1882	Robert Henry Thurston (1903)
1883	Erasmus Darwin Leavitt (1916)
1884	John Edson Sweet (1916)
1885	Josephus Flavius Holloway (1896)
1886	Coleman Sellers (1907)
1887	George H. Babcock (1893)

The page numbers in this section are preceded by the letters "RI," which are omitted in the following index.

CONSTITUTION, BY-LAWS, AND RULES

Amended to June 16, 1941

Article C1, Name and Government

Sec. 1. The name of this Society is The American Society of Mechanical Engineers.

Sec. 2. The Society is a corporation, organized April 7, 1880, and chartered under the laws of the State of New York, December 24, 1881.* A supplemental charter ** was issued on October 17, 1907, when the Society was consolidated with the Mechanical Engineers' Library Association.

The principal offices of the Society shall be in the City of New York.

Sec. 3. The Society shall be governed by this Constitution, the By-Laws, and the Rules.

Article B1, Government

Par. 1 Every question which shall come before a meeting of the Society or of the Council or of a committee, shall be decided by a majority of the votes cast, unless otherwise provided in the Constitution, the By-Laws and the Rules, or by the laws of the State of New York.

Par. 2 The Rules contained in "Robert's Rules of Order Revised" shall govern the Society in all cases to which they are applicable, when not inconsistent with the By-Laws or the Rules of this Society.

Article C2, Objects

Sec. 1. The objects of this Society are to promote the art and science of mechanical engineering and the allied arts and sciences; to encourage original research; to foster engineering education; to advance the standards of engineering; to promote the intercourse of engineers among themselves and with allied technologists; and severally and in cooperation with other engineering and technical societies to broaden the usefulness of the engineering profession.

Sec. 2. The Society may approve or adopt any report, standard, code, formula, or recommended practice, but shall forbid and oppose the use of its name, emblem, or initials in any commercial work or business, except to indicate conformity with its standards or recommended practices.

Article B2, Purposes

Par. 1 The objectives of the Society shall be accomplished by:

A Advancing the theory and practice of engineering and the allied arts and sciences by:

(*a*) Encouraging engineering research, tests, and other original work.

(*b*) Encouraging the preparation of original papers on engineering topics.

(*c*) Holding meetings for the presentation and discussion of original papers and participating in international engineering congresses.

(*d*) Publishing papers and reports and disseminating knowledge and experience of value to engineers.

(*e*) Developing and promulgating standards, codes, formulas, and recommended practices.

(*f*) Offering awards and other honors to encourage contributions to engineering; conferring awards and other honors in recognition of meritorious contributions to engineering.

(*g*) Furthering the purposes of the Engineering Societies Library, of which the Library of this Society forms a part.

(*h*) Encouraging intercourse among engineers for the mutual exchange of knowledge and experience.

B Enhancing the status of the engineer by:

(*a*) Maintaining high technical and cultural standards for entrance to the Society.

(*b*) Cooperating with educational institutions in the maintenance of high standards of engineering education.

(*c*) Requiring a high standard of ethical practice by members of the Society.

(*d*) Aiding in the adoption of a high standard of attainment for the granting of the legal right to practice professional engineering.

(*e*) Fostering among engineering students the study of philosophy and history, tradition and achievement, duties, and social functions of the engineering profession.

(*f*) Encouraging the personal and professional development of young engineers.

(*g*) Supporting activities looking to the increased employment of engineers and seeking new opportunities for engineering service.

C Increasing the usefulness of the organized engineering profession by:

(*a*) Cooperating with other engineering and technical societies.

(*b*) Encouraging a high standard of citizenship among engineers.

(*c*) Encouraging engineers to participate in public affairs.

(*d*) Cooperating with governmental agencies in engineering matters.

(*e*) Publicity for the engineering profession through the achievements of engineers.

Par. 2 The closest possible cooperation with universities and technical schools qualified and equipped to assist in the development and conduct of special research work is favored and is strongly urged.

Par. 3 Cooperative, not competitive, methods should be worked out with existing research laboratories and activities in other organizations. Such cooperation could take the form of publication of papers and groups of papers where a definite industry desires to bring to the attention of engineers for the development of the industry, any problem or special research, without commercial bias.

Par. 4 Each suggested research must be presented, on its individual merit, for approval by the Council, which will in turn refer the matter to the appropriate authority or committee.

Par. 5. Specific requests to the Council for solicitation of funds are to be accompanied with full details for proposed scope, method of solicitation, and budget.

Par. 6 No contributor is to be specially favored on account of any contribution for a research in which he is interested and a contribution can be received only on the basis of general benefit to the industry.

Article R2, Affiliated Organizations

Rule 1 The Council may approve the affiliation with the Society of any engineering society or legally organized group of engineers whose objects are in accord with the traditions, precedents, and objects of this Society.

Rule 2 The term "Affiliated with The American Society of Mechanical Engineers" shall be used by any society or by individual members of it only while the respective governing boards of both societies continue the affiliation.

---

* The original charter or certificate of incorporation was reproduced in facsimile form in the Transactions for 1937, pages RI-37–RI-42.

** The Supplemental Charter of October 17, 1907, also provided that the number of Directors shall be twenty-two (22).

Rule 3 Affiliation with this Society of any other organization shall in no wise be interpreted as interfering with the independence, autonomy, and self-control of that organization under its own constitution or by-laws.

Rule 4 The Society shall not be responsible for any act of any affiliated society.

Rule 5 Affiliation with this Society of any other organization may be terminated by the governing board of either giving sixty (60) days' written notice to the governing board of the other.

Article C3, Membership

Sec. 1. The corporate membership shall consist of Fellows, Members, and Junior Members. In addition there shall be Honorary Members, Associates, and Student-members.

Sec. 2. The rights and privileges of every member shall be personal to himself and shall not be transferable except that each corporate member shall be entitled to vote on any question before the Society either in person or by a proxy given to a corporate member.

Sec. 3. Every person admitted to membership shall be subject to the Constitution of the Society, and to any amendments that may be made from time to time.

Article B3, Membership

Par. 1 The Council shall have power by resolution from time to time, to fix the number of Honorary Members.

Par. 2 A proxy may be given to a member entitled to vote, but shall not be valid for more than six (6) months. Such proxy shall be signed, with an attesting witness, by the member giving it and shall be submitted to the Secretary for verification of the right of the member to vote at the meeting at which the proxy is to be used.

Par. 3 Proffered resignations shall be presented to the Council for action, and shall be accepted if the requirements have been met. Each resignation presented to the Council after the fiscal year has commenced (October first) must be accompanied by a statement from the Secretary that the member has paid his dues up to and including the expired portion of the current fiscal year, unless such resignation is presented by January first, when no payment of current dues shall be required.

Article R3, Membership

Rule 1 Each member shall be entitled to a certificate of membership, signed by the President and the Secretary of the Society; it shall remain the property of the Society and be returned on demand. Each member requesting a certificate shall pay the cost of engrossing.

Rule 2 Abbreviations of the titles to be used by members are as follows:

Honorary Member	Hon. Mem. A.S.M.E.
Fellow	Fellow A.S.M.E.
Member	Mem. A.S.M.E.
Associate	Assoc. A.S.M.E.
Junior Member	Jun. A.S.M.E.
Student-member	Student A.S.M.E.

Rule 3 Each member shall be entitled to wear the emblem approved by the Council for his grade of membership.

Rule 4 Each member desiring to resign shall deposit with the Secretary any badge and certificate of membership in his possession, and upon acceptance of his resignation the Secretary shall make him the stipulated refund for his badge.

Article C4, Qualifications for Admission

Sec. 1. Members of all grades shall be elected by the Council.

Sec. 2. An Honorary Member shall be a person of acknowledged professional eminence.

Sec. 3. A Fellow shall be an engineer who shall have distinct engineering attainments, twenty-five (25) years of active practice in the profession of engineering or teaching of engineering in a school of accepted standing, and shall have been thirteen (13) years in the grade of Member. Graduation from an engineering school of accepted standing shall be considered equivalent to four (4) years of active practice.

Sec. 4. An engineer lacking the qualifications of Section 3 who has distinguished engineering or scientific attainments may be elected a Fellow by unanimous vote of Council members voting.

Sec. 5. A Member shall be an engineer or teacher of engineering who shall have reached the age of thirty (30) years and who shall have had nine (9) years active practice in the profession of engineering or teaching, three (3) years of which shall have been in a position of responsible charge of important work and who is qualified to design as well as direct such work. Graduation from a school of engineering of accepted standing shall be considered equivalent to four (4) years of active practice.

Sec. 6. An Associate need not be an engineer but must have a record of recognized leadership in some profession, or branch of industry, or science relating to engineering, and shall be qualified to cooperate with engineers in the practice of their profession and he must be at least thirty (30) years of age.

Sec. 7. A Junior Member shall be a graduate of a school of engineering of accepted standing or one who has equivalent attainments.

Sec. 8. A Student-member shall be a student regularly enrolled and pursuing an approved engineering curriculum in a school having a Student Branch of this Society.

Article B4, Qualifications for Admission

Par. 1 A candidate for admission to the Society in any grade, except Honorary Membership, or a member desiring to change his grade, shall make application to the Council on an approved form.

Par. 2 Fifteen (15) affirmative votes of the Council shall be required for the election of a candidate for any grade except Honorary Membership. Two (2) negative votes shall defeat an election.

Par. 3 Each approved candidate shall be assigned by the Council to the grade of membership to which, in its judgment, his qualifications entitle him.

Par. 4 Nomination for Honorary Membership may be made to the Council by at least twenty-five (25) members of the Society, who shall in all cases state in writing the grounds upon which the nomination is made.

Par. 5 Election to Honorary Membership shall be by letter-ballot of the Council. Ballots shall be mailed by the Secretary to each member of the Council at least twenty-one (21) days in advance of the date set for the closure of such election. One (1) negative vote shall defeat an election to Honorary Membership.

Par. 6 All matters relating to admissions to and promotions in membership shall be in charge of the Standing Committee on Admissions, under the direction of the Council.

Par. 7 A Student-member may participate in all the activities of the Society but shall not be permitted to vote or hold an elective office except in the Student Branch located at the college of which he is a student.

Par. 8 A Student-member shall not remain in this grade beyond the end of the Society's fiscal year in which he terminates his enrollment as a student.

Article R4, Qualifications for Admission

Rule 1 A candidate for admission to the Society as a Fellow, a Member, or an Associate, should refer to at least five (5) members who have personal knowledge of his qualifications and the grade of reference shall be as follows:

For Fellow, at least one (1) Fellow and the remainder Members
For Member, at least five (5) Fellows or Members

For Associate, at least three (3) Fellows or Members and the remainder Associates.

Rule 2 A candidate for admission to the Society as a Junior Member should refer to at least three (3) members who have personal knowledge of his qualifications, at least one of whom shall be a Fellow, Member, or Associate.

Rule 3 A candidate for admission to the Society as a Student-member must be endorsed by the Honorary Chairman in office at the Student Branch located at the college where he is a student.

Rule 4 An application for membership from a candidate who may not be able to give the necessary number of references may be recommended to the Council for ballot after sufficient evidence has been secured to show that the candidate is worthy of admission to membership. Such candidates may refer to officers or voting members of other societies of like standing.

Rule 5 An application may be referred by the Committee on Admissions to the executive committee of the Local Section to which the applicant would be logically attached, for information and comment by such local committee. If, after a period of twenty (20) days, no comment is received from the local committee, the Committee on Admissions will proceed with the consideration of the application.

Rule 6 The references for each candidate shall be requested to make such confidential communications to the Committee on Admissions as will enable it to arrive at a proper estimate of the eligibility of the candidate.

Rule 7 The Committee on Admissions shall report to each session of the Council the names of all candidates together with the recommendation on each. The Committee on Admissions shall meet monthly to receive and scrutinize applications, and shall seek further information as to the qualification of a candidate whose evidence of eligibility is not clear to them.

Rule 8 All confidential correspondence in relation to each candidate shall be destroyed by the administrative officer in charge of membership admissions within a reasonable period after acceptance of election by payment of the initiation or promotion fees and dues.

Rule 9 The Secretary shall mail to each member of the Council a ballot of the names and respective grades of the candidates for membership approved by the Committee on Admissions after having been duly posted in the publications of the Society. The voter shall prepare his ballot by crossing out the name of any candidate rejected by him, and shall enclose the ballot in an envelope and seal it. He shall enclose this envelope in a second envelope and sign it for identification. A ballot without the autographic endorsement of the voter on the outer envelope is defective and shall be rejected.

Rule 10 The Secretary shall count the ballots cast by the Council for election of new members, notify the applicants of their election, and regularly report the results of the ballot at the Council meeting next following each election. The names of applicants who are not elected shall neither be announced nor recorded.

Article C5, Fees and Dues

Sec. 1. Initiation Fees:

Honorary Member	None
Fellow	$30
Member	25
Associate	25
Junior Member	10
Student-Member	None

Promotion Fees:

From Member to Fellow	5
From Junior Member to Member or Associate	10

(Except that an applicant under the age of 33 who has been a Junior Member in good standing for five consecutive years may be promoted without fee.)

From Student-member to Junior Member	None

Sec. 2. The annual dues for membership in each grade shall be:

Fellow	$25
Member	20
Associate	20
Junior Member until reaching the age of 30	10
Junior Member between the ages of 30 and 33	$15
Junior Member after reaching the age of 33	20
Student-member	as provided in the By-Laws

Sec. 3. The Council may permit any Fellow, Member, or Associate to become a life member in the same grade.

Sec. 4. The Council may remit the dues of any member for any special reason.

Article B5, Fees and Dues

Par. 1 The initiation fee and that part of the annual dues from the first month following the date of election to the first day of October, shall be due and payable on the first day of the month following the date of election. Only upon the payment of this amount shall the person elected be entitled to the rights and privileges of membership in the grade to which he is assigned. If such person does not comply with this requirement within three (3) months after notice of his election, the Council may declare his election void.

Par. 2 The annual dues for each ensuing year shall be due and payable in advance on the first day of October.

Par. 3 A bill for annual dues shall be mailed to each member by October first of each year. Notice of arrears shall be sent thereafter, as directed by the Council.

Par. 4 At its first meeting in the calendar year the Secretary shall submit to the Council a list of members whose dues have remained unpaid for three (3) months. The Council may order the withholding of the publications for such delinquents.

Par. 5 At its first meeting after the close of the fiscal year on September thirtieth, the Secretary shall submit to the Council a list of members whose dues have remained unpaid for twelve (12) months. Such delinquents shall, in the discretion of the Council, be stricken from the roll of membership and shall cease to have any further rights as members.

Par. 6 If, in the case of non-payment of dues, the right to receive the publications of the Society or to vote be questioned, the books of the Society shall be conclusive evidence.

Par. 7 The Council may temporarily excuse from payment of annual dues any member who from ill health, advanced age or good reason assigned is unable to pay such dues; and the Council may remit the whole or part of dues in arrears, or accept in lieu thereof desirable additions to the Library, or collections.

Par. 8 The Council may restore to membership any person dropped from the rolls for non-payment of dues or otherwise, upon such conditions as it may deem best.

Par. 9 The annual dues for a Student-member shall be $3.00 for the fiscal year beginning October first. Eight issues of *Mechanical Engineering*, October to May inclusive, shall be included in the dues for a Student-member.

Par. 10 For distinguished service to the Society, the Council may confer life membership upon any Fellow or Member. Proposal for such action must be made at a regular meeting of the Council. Immediately following that meeting, the Secretary shall send to the members of the Council a letter ballot upon the proposal, this ballot to close in sixty (60) days. Fifteen (15) affirmative votes shall be required to approve and one (1) dissenting vote shall disapprove such proposal.

Par. 11 A Fellow, Member, or Associate may become a Life Fellow, Life Member, or Life Associate by paying the Society at one time the present worth of an annuity equal to that member's dues for the period for which he is required to pay dues.

Par. 12 The Council shall confer life membership upon any Fellow, Member, or Associate of the Society who has paid dues for thirty-five (35) years, or who shall have reached the age of seventy (70) years after having paid dues for thirty (30) years (Student-membership years not included).

Article R5, Fees and Dues

Rule 1 A Student-member recommended by the Honorary Chairman of his Student Branch may be elected by the Council to Junior membership, the election being subject to his graduation. The payment of dues as a Junior Member for one year at any time prior to September 30 of the calendar year following the calendar year in which he graduates, shall constitute acceptance of election and shall give him all the rights and privileges of the Junior Member grade from the date of such payment to September 30 of the calendar year following the calendar year in which he graduated.

Rule 2 The Student-member may pay an initial quarter year's dues, \$2.50, to indicate acceptance of election. If he chooses this method, the remaining three quarter's of the dues, \$7.50, shall be due not later than the first of the month following a three months' period thereafter. If he follows this procedure he will receive publications for the periods paid but no other services until election is accepted by payment of the full year's dues. If he does not accept or follow this procedure and complete his payments before September 30 of the calendar year following the calendar year in which he graduated, the automatic scheme of transfer without initiation fee expires and thereafter he must make a new application for Junior membership and if elected pay an initiation fee of \$10.00.

Article C6, The Council (Directors)

Sec. 1. The affairs of the Society shall be managed by a Board of Directors, chosen from its membership and styled "The Council" which shall have full control of the activities of the Society, subject to the limitations of the Constitution and the results of letter ballots (Article B9, Par. 4 and Article B6, Par. 3).

Sec. 2. The Directors of the Society shall consist of a President, seven (7) Vice-Presidents, nine (9) Managers, and the last five (5) surviving Past-Presidents.

Sec. 3. The Directors may at any time, whenever sufficient cause shall appear to them, delegate to any corporate member of the Society the performance of any duties required by the Constitution to be performed by any Director.

Sec. 4. The Council shall meet immediately after the close of the Annual Meeting of the Society, at such other times as the Council may select, and at the call of the President. Eight members shall constitute a quorum of the Council.

Sec. 5. The Council shall present at the Annual Meeting of the Society a report verified by the President and the Treasurer or by twelve (12) members of the Council, showing the whole amount of real and personal property owned by the Society, where located, and where and how invested, and the amount and nature of the property acquired during the year immediately preceding the date of the report, and the manner of the acquisition; the amount applied, appropriated, or expended during the year immediately preceding such date, and the purpose, object, or persons to or for which such applications, appropriations, or expenditures have been made; also a report verified by the Secretary, giving the names and places of residence of the persons who have been admitted into membership in the Society during the year.

These reports shall be filed with the records of the Society, and an abstract shall be entered in the minutes of the proceedings of the Annual Meeting of the Society.

Article B6, The Council

Par. 1 The Council shall consider the failure of any incumbent, from inability or otherwise, to perform the duties of his office, and may, by a two-thirds vote, decree any elective office vacant. The Council shall thereupon appoint a member to fill the vacancy until the next election of officers, except for the office of the President, which shall be filled by the Vice-President serving his second year, who is senior by length of membership in the Society. Such appointment shall not render the appointee ineligible for election to any office.

Par. 2 An act of the Council which shall have received the expressed or implied sanction of the membership at the following meeting of the Society, shall be deemed to be an act of the Society and cannot afterward be impeached by any member.

Par. 3 The Council shall order the submission to the membership for decision by letter-ballot of any question of major importance involving a departure from usual custom. The Council shall appoint tellers to canvass such a ballot, the result of which shall be binding.

Article B6A, Standing and Special Committees

Par. 1 The Council shall at its first meeting of each year appoint from among its members an Executive Committee. Such committee shall consist of the President, two Vice-Presidents, and two Managers, with voting power; also the Chairman of the Finance Committee, the Chairman of the Committee on Professional Divisions and the Chairman of the Local Sections Committee, without voting power. During the intervals between sessions of the Council, the Executive Committee shall have and exercise all the general powers of the Council, except the power to fill vacancies in the Council, or to amend the By-Laws. The committee shall meet at the call of the President. The Secretary may take part in the deliberations of the Executive Committee, without vote. The Executive Committee shall keep minutes of its proceedings which shall be promptly reported to each member of the Council for approval.

Par. 2 Upon the recommendation of a business meeting of the Society or upon its own initiative, the Council shall have the power to appoint, as it may deem desirable, an Administrative Committee to assist in the conduct of the affairs of the Society. Any proposed expenditure of such a committee must be authorized by the Council before it is incurred.

Par. 3 Upon the recommendation of a business meeting of the Society or upon its own initiative, the Council shall have the power to appoint, as it may deem desirable, any Professional Committee to investigate and report upon a subject of engineering interest, except that the procedure of the American Standards Association shall be followed in organizing Sectional Committees. (See Paragraphs 10 and 11 of Article B6B.) Any proposed expenditure of such a committee must be authorized by the Council before it is incurred.

Par. 4 Administrative and Professional Committees shall be standing or special, as the By-Laws and Rules provide and the Council approves. The Chairmen of Standing Committees shall be entitled to a seat in the Council, but no vote. The term of office of one (1) member of each Standing Committee shall expire at the close of each Annual Meeting.

Par. 5 Each committee shall perform the duties required by the By-Laws and Rules, or assigned to it by the Council.

Par. 6 The Council may terminate membership on any committee on account of continued absence of the member, from inability or otherwise.

Par. 7 The President shall appoint a member to fill each vacancy in the Standing Committees.

Par. 8 Each committee shall at its first meeting elect a Chairman to serve for one (1) year.

Par. 9 A member of a Standing Committee whose term of office has expired, shall continue to serve until his successor has been elected or appointed.

Par. 10 On or before the fifteenth day of October of each year, each Standing Committee shall deliver to the Secretary a written report of its work for presentation to the Council. The Council may embody such report in its Annual Report.

Par. 11 On or before the fifteenth day of October of each year, each Special Committee shall deliver a written progress report to the Secretary for presentation to the Council. Upon receipt of this report, the Council may, in its discretion, continue the committee.

The committee shall be discharged upon the adoption of the final report.

PAR. 12 The Standing Committee on Finance shall, under the direction of the Council, have supervision of the financial affairs of the Society, including the books of account. The Committee shall consist of five (5) members of the Society, the term of one (1) member expiring at the close of each Annual Meeting, and two (2) members of the Council, the term of one (1) member expiring at the close of each Annual Meeting.

PAR. 13 The Standing Committee on Meetings and Program shall, under the direction of the Council, have supervision of the Meetings of the Society, except business meetings. The Committee shall consist of five (5) members, and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 14 The Standing Committee on Publications shall, under the direction of the Council, have supervision of the publications of the Society. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 15 The Standing Committee on Admissions shall determine the eligibility of applicants for membership, and for transfer in membership grades, and shall make recommendation to the Council on each. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 16 The Standing Committee on Professional Divisions shall, under the direction of the Council, have supervision of the Professional Divisions of the Society. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 17 The Standing Committee on Local Sections shall, under the direction of the Council, have supervision of the Local Sections of the Society. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 18 The Standing Committee on Constitution and By-Laws shall, under the direction of the Council, have supervision of matters affecting the Constitution, By-Laws, and Rules, and shall report on all matters in this connection referred to it by the Council. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 19 The Standing Committee, designated as the Board of Honors and Awards shall, under the direction of the Council, have supervision of the awards of the Society as detailed in the Rules or prescribed by the Council. Recommendations for representatives of joint bodies of award shall be made to the Council by this Board. The Board shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 20 The Standing Committee on Relations With Colleges shall, under the direction of the Council, have supervision of the Student Branches of the Society and of such work of the Society as aims to further the education of engineers through the colleges and schools of accepted standing. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 21 The Standing Committee on Education and Training for the Industries shall, under the direction of the Council, have supervision of such work of the Society as deals with education and training for the industries through agencies other than the colleges and engineering schools. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 22 There shall be a Standing Committee on Library, which shall represent the Society on the Library Board of the United Engineering Trustees, Inc. The number of members of this Committee and their terms of office shall be as required by the by-laws of the United Engineering Trustees, Inc.

PAR. 23 The Standing Committee on Standardization shall advise the Council on the dimensional standardization work of the Society, including relations with the American Standards Association. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 24 The Standing Committee on Research shall, under the direction of the Council, have supervision of the research activities of the Society. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 25 The Standing Committee on Safety shall advise the Council on the activities of the Society having to do with engineering and industrial safety, except the activities of the Boiler Code Committee, for which special provision is made. This Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

PAR. 26 The Special Committee on Boiler Code shall, under the direction of the Council, have supervision of all activities of the Society in connection with the A.S.M.E. Codes for Pressure Vessels, including the interpretations of these codes. The Committee shall be appointed by the President and confirmed by the Council, and the President shall fill all vacancies in the Committee.

PAR. 27 The Standing Committee on Power Test Codes shall, under the direction of the Council, have supervision of all the activities of the Society in connection with the A.S.M.E. Power Test Codes, including the interpretation of such codes. The Committee shall consist of twenty-five (25) members and the terms of five (5) members shall expire at the close of each Annual Meeting.

PAR. 28 The Standing Committee on Professional Conduct shall, under the direction of the Council, have supervision of all matters relating to the Code of Ethics and its enforcement. The Committee shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting.

B6B, SOCIETY REPRESENTATION

PAR. 1 The Council may, in its discretion, appoint a member or members, or other person or persons, to represent it at meetings of societies of kindred aim or at public functions. Such delegates shall be designated as "Honorary Vice-Presidents," and their duties shall terminate with the occasion for which they are appointed.

PAR. 2 The President, subject to the approval of the Council, may nominate or appoint a member or members, or other person or persons, to represent the Society on professional or other committees organized by other societies or by Government departments or bureaus, or otherwise.

PAR. 3 The Council shall elect three (3) Trustees to serve on the Board of Trustees of the United Engineering Trustees, Inc., as required in the by-laws of that body.

PAR. 4 The Council shall appoint delegates to serve on the American Engineering Council as required in the by-laws of that body. If the number of delegates required to serve is at variance with the number elected or in office, the Council of the Society is empowered to make adjustments necessary. The President of the Society in office shall be the Chairman of the delegation of this Society to the meetings of the American Engineering Council, and the Chairman of the A.S.M.E. representatives on the Executive Board.

PAR. 5 The Council shall designate the Standing Committee on Library to serve as the Society's representatives on the Library Board of the United Engineering Trustees, Inc., as required in the by-laws of that body.

PAR. 6 The Council shall nominate to the United Engineering Trustees, Inc., two (2) members of the Society to serve on the Engineering Foundation as required in the by-laws of that body.

PAR. 7 The Council shall appoint such number of members to represent the Society on the following agencies as may be required by the by-laws of those bodies, namely: John Fritz Medal Board of Award, Washington Award Commission of the Western Society of Engineers, Gantt Medal Board of Award, Daniel Guggenheim Medal Fund, Inc., Hoover Medal Board of Award, Alfred Noble Prize.

PAR. 8 The Council shall nominate three (3) members to represent the Society on the Division of Engineering of the

National Research Council as required in the by-laws of that body.

PAR. 9 The Council shall appoint three (3) members of the Society to represent the Society on the Engineers' Council for Professional Development.

PAR. 10 The Council shall designate such number of members to represent the Society on the American Standards Association as may be required by the constitution of that body.

PAR. 11 The representatives of the Society on Sectional Committees, organized under the rules of the American Standards Association, shall be appointed by the President, subject to the approval of the Council.

ARTICLE C7, ELECTION OF DIRECTORS

SEC. 1. The membership of the Society shall elect annually a Regular Nominating Committee, whose duty shall be to select candidates for the executive offices to be filled at each annual election.

SEC. 2. Other nominating committees having the same powers may be constituted by the membership of the Society.

SEC. 3. Directors shall be elected annually by sealed letter-ballot of the membership.

SEC. 4. The President shall be elected for one (1) year, the Vice-Presidents for two (2) years, the Managers for three (3) years. The Council shall have power to fill vacancies in its membership by appointment until the next election, except that the office of president shall be filled by the vice-president who is senior by length of membership in the Society.

ARTICLE B7, ELECTION OF DIRECTORS

PAR. 1 The Regular Nominating Committee of the Society shall consist of eight (8) members with eight (8) alternates elected at the Annual Meeting. The Chairman of the outgoing Nominating Committee shall serve as an advisory member, without vote, and the Secretary of the outgoing Committee may serve as alternate for him.

PAR. 2 The members and alternates of the Regular Nominating Committee shall be elected for one (1) year, and no member or alternate shall be eligible for more than two (2) consecutive terms. Serving as an alternate shall not affect the eligibility of a member to serve on the committee for two (2) terms.

PAR. 3 For the purpose of nominating members of the Regular Nominating Committee, the Council shall, on or before the first day of October of each year, associate the Local Sections into eight (8) groups, each group to be responsible for nominating one (1) member of the Committee. The Sections which will comprise these groups shall, as far as possible, be contiguous geographically to each other.

PAR. 4 The names of those elected to serve on the Regular Nominating Committee shall be published by the Secretary by the first week in February of each year, accompanied by a request for suggestions for nominees.

PAR. 5 A vacancy in a Regular Nominating Committee of the Society shall be filled by the alternate for that vacancy, or failing that, shall be filled by the Council.

PAR. 6 A Special Nominating Committee may be organized by any group of one (1) per cent of the membership of the Society in good standing certifying to the Secretary in writing their joint intention to organize such a Committee.

PAR. 7 Within two weeks following the Semi-Annual Meeting, the Regular Nominating Committee shall deliver to the Secretary in writing the names of its nominees for the elective offices to be filled at the next election, together with the written consents of the nominees.

PAR. 8 The names and qualifications of nominees for the various offices proposed by the Regular Nominating Committee shall be published by the Secretary immediately after the receipt of the report of the Nominating Committee.

PAR. 9 Candidates for the office of President and of Vice-President shall be of the grade of Fellow or of Member of the Society. Candidates for all other elective offices may be of any grade of corporate membership.

PAR. 10 Names of any nominees presented by any Special Nominating Committee must be in the hands of the Secretary by the first Tuesday in August of each year, and must be accompanied by the written consent of each nominee.

PAR. 11 On or before the third Thursday in August of each year, the Secretary shall mail to each member entitled to vote a ballot stating the names of the candidates for the elective offices to be filled at the next election.

PAR. 12 Voting for the election of Directors shall close at the City of New York at 10 o'clock in the forenoon on the fourth Tuesday in September in each year, and the ballots shall be canvassed.

PAR. 13 On or before the third Thursday in August of each year, the President shall appoint three (3) Tellers of Election of Directors, whose duty it shall be to canvass the votes cast. The term of office of the Tellers shall expire when their report of the canvass has been presented and accepted.

PAR. 14 By the first day of October, the Secretary shall notify the candidates having the greatest number of votes for their respective offices.

PAR. 15 The Directors shall be declared elected by the Presiding Officer at the Annual Meeting of the Society in December, and their terms of office shall begin on the adjournment of the Annual Meeting.

PAR. 16 If a tie occurs in the vote for any officer, the Presiding Officer at the Annual Meeting shall cast the deciding vote.

PAR. 17 In the election of the Vice-Presidents, three (3) shall be elected every other year and four (4) the alternate years to serve for two (2) years.

PAR. 18 In the election of the Managers, three (3) shall be elected each year to serve for three (3) years.

PAR. 19 A member in office shall not be eligible for immediate re-election to the same office at the expiration of the term for which he was elected, except the Secretary and the Treasurer.

PAR. 20 Members in office shall continue in their respective offices until their successors have been elected or appointed, and have accepted their offices.

ARTICLE R7, ELECTION OF DIRECTORS

RULE 1 The Chairman of the Committee on Local Sections, or in his absence, the senior member of the Committee, shall preside at the Conference of Group Representatives at the time action is taken on the Regular Nominating Committee.

RULE 2 At the business session of the Annual Meeting of the Society, the Chairman of the Committee on Local Sections shall present names recommended by the conference for the Regular Nominating Committee.

RULE 3 The names of the candidates proposed by the Regular Nominating Committee and by any other nominating committee, and the respective offices for which they are candidates, shall be printed in separate lists on the same ballot sheet, each list of candidates to be printed under the names of the members of the particular committee which proposed it.

RULE 4 Each list of names shall contain the name of only one (1) candidate for the office of President. For any other office than President, there may be more than one (1) candidate.

RULE 5 In the election of Directors, the voter shall prepare his ballot by crossing out the name of any candidate or candidates rejected by him and may write in the name of any eligible member of the Society, and shall enclose the ballot in an envelope and seal it. He shall then enclose this envelope in a second envelope marked "Ballot for Directors" and seal it, and he shall then write his name thereon for identification.

RULE 6 The Tellers shall not receive any ballot after the stated time for the closure of the voting.

RULE 7 The Secretary shall certify to the competency and signature of all voters.

RULE 8 The Tellers shall open and destroy the outer envelopes and then open the inner envelopes and canvass the results.

RULE 9 A ballot without the autographic endorsement of the voter on the outside envelope is defective and shall be rejected by the Tellers of Election.

RULE 10 A ballot containing more names than there are offices to be filled is defective and shall be rejected by the Tellers.

RULE 11 In counting the ballots for officers, the Tellers shall consider a ballot for any officer as valid providing the intent of the voter as to that particular office is clear, even though his ballot as to candidates for another office may for any reason be invalid.

ARTICLE C8, OFFICERS

Sec. 1. The Officers of the Society shall consist of the President, the Vice-President, the Secretary, and the Treasurer.

Sec. 2. At its first meeting after the Annual Meeting of the Society the Council shall appoint members of the Society to serve as Secretary and as Treasurer for one (1) year.

Sec. 3. Any vacancy in the office of Secretary or Treasurer shall be filled by appointment by the Council.

B8 OFFICERS

PAR. 1 The Officers shall perform the duties regularly or customarily attaching to their offices under the laws of the State of New York, and such other duties as may be required of them by the Council or the By-Laws.

PAR. 2 In the absence of the President his duties shall be performed by the Vice-President then present, who is serving his second year and is senior by length of membership in the Society, or in his absence or any other disability, by any other member of the Council designated by the Council.

PAR. 3 The Secretary and the Treasurer shall take part in the deliberations of the Council but shall have no vote therein.

PAR. 4 The Treasurer shall be the legal custodian of all funds of the Society. The investment of all trust funds and of other permanent or temporary investment of funds shall be made by the Treasurer with the approval of the Finance Committee and the Council.

PAR. 5 In the absence of the Treasurer his duties shall be performed by any other officer of the Society designated by the Council.

PAR. 6 The Secretary of the Society shall be the Secretary of the Council and of each of the committees.

PAR. 7 The Secretary shall receive a salary which shall be fixed by the Council.

PAR. 8 Any officer may be subject to removal for cause by a vote of fifteen (15) members of the Council at any time, after one (1) month's written notice has been given him to show cause why he should not be removed, and after he has been heard in his own defense, if he so desires.

R8, SECRETARY'S OFFICE

RULE 1 The office of the Secretary shall be open on business days from 9 a.m. to 5 p.m.; on Saturdays from 9 a.m. to 1 p.m.

RULE 2 The Secretary shall establish and enforce rules for the conduct of the business of his office.

RULE 3 The Secretary shall have charge of the rooms of the Society and furnishings, the historical relics and objects of art, and shall make suitable recommendations to the Council for their care and use.

ARTICLE C9, MEETINGS OF THE SOCIETY

Sec. 1. The Annual Meeting of the Society shall be held at such time and place as the Council shall appoint.

Sec. 2. The Semi-Annual Meeting of the Society shall be held at such time and place as the Council shall appoint.

Sec. 3. A special business meeting of the Society may be called at any time and place at the discretion of the Council, or shall be called by the Secretary upon the written request of at least one (1) per cent of the membership.

The call for the meeting shall be issued at least thirty (30) days prior to the date set for it, and shall state the business to be considered. No other business shall be transacted at the meeting.

Sec. 4. There shall be a business meeting of the Society during the Annual Meeting and during the Semi-Annual Meeting. At business meetings fifty (50) corporate members shall constitute a quorum.

Sec. 5. An action of a business meeting of the Society shall be deemed an action of the Society as a whole. Any expenditure required by such action is subject to approval and authorization by the Council.

Sec. 6. A General Meeting of the Society, primarily for the presentation and discussion of technical papers, may be held at such time and place as the Council shall appoint.

ARTICLE B9, MEETINGS OF THE SOCIETY

PAR. 1 A Semi-Annual Meeting shall be held upon the recommendation of the Committee on Local Sections, confirmed by the Committee on Meetings and Program, and authorized by the Council at its regular meeting at the previous Semi-Annual Meeting.

PAR. 2 A General Meeting shall be held upon the recommendation of the Committee on Local Sections, confirmed by the Committee on Meetings and Program, and authorized by the Council.

PAR. 3 Any business meeting of the Society at which a quorum is present may order the submission of any question to the membership for letter-ballot, and the result of the ballot shall be binding.

PAR. 4 Announcements of all Meetings of the Society shall be made in the publications. A notice of each meeting shall be given by the Secretary to each member not less than thirty (30) days before the date of that meeting.

PAR. 5 All Meetings of the Society, except business meetings, shall be in charge of the Committee on Meetings and Program, under the direction of the Council.

ARTICLE R9, MEETINGS OF THE SOCIETY

RULE 1 Subject to the approval of the Committee on Meetings and Program, any Local Sections participating in the conduct of a Semi-Annual or General Meeting shall appoint the necessary special local committees which shall function under the direction of the Committee on Meetings and Program.

ARTICLE C10, PROFESSIONAL DIVISIONS

Sec. 1. The Council may authorize the organization of Professional Divisions composed of members of any or all grades which shall operate under the provisions of the Constitution, By-Laws, and Rules.

ARTICLE B10, PROFESSIONAL DIVISIONS

PAR. 1 The object of each Professional Division shall be to provide, through an organization of members of any or all grades particularly interested in a branch of engineering included in the scope of the Society's activities, means for promoting the arts and sciences of that branch.

PAR. 2 A Professional Division of the Society may be organized upon acceptance by the Council of the written request of a satisfactory number of members. Such a Division shall be designated as the .... Division of The American Society of Mechanical Engineers.

PAR. 3 The provisions of the Constitution, By-Laws, and Rules of the Society shall cover the procedure of all Professional Divisions, but no action or obligation of a Division shall be considered an action or obligation of the Society as a whole. This By-Law shall be imprinted on any publication issued by a Division.

PAR. 4 For the convenient conduct of its affairs, each Professional Division shall organize an executive committee. The executive committee shall elect its Chairman each year, and upon confirmation by the Council, he shall serve as Chairman of the Division.

Par. 5 The function of the Standing Committee on Professional Divisions, under the direction of the Council, shall be to organize, foster, and coordinate Professional Divisions and their activities.

Professional Groups

Par. 6 In case the number of members interested in a particular branch of the Society's work is not large enough to warrant the formation of a full Professional Division under the provisions of the By-Laws, the Council may authorize the formation of a Professional Group, and will itself appoint an executive committee to organize such a Group, and will designate the Chairman of the Committee. When a sufficient number of members become attached to this Group, it may petition for reorganization into a Professional Division.

Article R10, Professional Divisions

Rule 1 When a number of members of the Society interested in a particular branch of the work of the Society favor the formation of a Professional Division for that branch, they may draw up a petition for the establishment of such a Division. Each such petition shall be sent to the Standing Committee on Professional Divisions for presentation to the Council with its recommendation. Upon approval of the petition by the Council, the Chairman of the Standing Committee on Professional Divisions shall appoint a temporary Chairman of the New Division.

Rule 2 The executive committee of each Professional Division shall consist of five (5) members and the term of one (1) member shall expire at the close of each Annual Meeting. The executive committee and such officers as the Division may require shall be selected from the membership of the Society. Other committees, advisors, and associates of the Division shall be appointed by the executive committee as required for a term not exceeding one (1) year.

Rule 3 Upon the organization of a Professional Division the initial selection of the executive committee shall be made by the President upon the nomination of the Standing Committee on Professional Divisions which will state the length of term of each appointee.

Rule 4 During the month of October of each year the executive committee of each Division will nominate to the President through the Standing Committee on Professional Divisions one or more individuals from whom the President shall appoint the member of the executive committee.

Rule 5 The executive committee of each Professional Division shall elect its own officers. No one shall be eligible for chairmanship until he has been a member of this committee for one year, except in the selection of the executive committee for a newly formed Division.

Rule 6 In case of resignation or decease, vacancies shall be filled by appointment of the executive committee subject to the approval of the President of the Society.

Rule 7 The executive committee may, subject to the approval of the Secretary of the Society, appoint or elect a secretary of the Division, who shall report the proceedings of that Division to the Secretary of the Society for notice in the publications. He shall perform the duties of secretary of the Division, and such other duties as may be prescribed by the executive committee.

Rule 8 Any expenditure for the purpose of a Division chargeable to the Society must be authorized by the Secretary of the Society before it is incurred, and must be provided for in the annual budget approved by the Council. Any liability otherwise incurred shall not be binding on the Society, and must be met by the Division itself.

Rule 9 Notice of all Professional Division meetings shall be given in writing to the Secretary of the Society and to the Chairman of the Standing Committee on Professional Divisions at least six (6) weeks in advance of the date set for such meetings.

Professional Groups

Rule 10 The functions and responsibilities of a Professional Group shall be the same as those of a Professional Division, except that the Chairman of the executive committee, although having a seat in the conferences of the Chairmen of the Professional Divisions shall have no vote.

Rule 11 The activities of a Professional Group shall be subject to the jurisdiction of the Standing Committee on Professional Divisions.

Rule 12 The Council reserves the right to disband any Professional Group on sixty (60) days' notice.

Article C11, Local Sections

Sec. 1. The Council may authorize the organization of Local Sections composed of members of any or all grades, which shall operate under the provisions of the Constitution, By-Laws, and Rules.

Sec. 2. The Local Sections shall be associated into geographical groups with annual meetings at which each Local Section shall be entitled to representation. Each geographical group shall be entitled to representation in a subsequent conference of group representatives at the Annual Meeting of the Society.

Article B11, Local Sections

Par. 1 The object of a Local Section of the Society shall be to provide means for promoting the work of the Society by a local organization of members who are resident within a given territory.

Par. 2 A Local Section shall consist of members of any or all grades.

Par. 3 A Local Section of the Society may be organized upon acceptance by the Council of the written request of a satisfactory number of members. Such a Section shall be designated as the .... Section of The American Society of Mechanical Engineers.

Par. 4 The provisions of the Constitution, By-Laws, and Rules of the Society shall cover the procedure of all Local Sections, but no action or obligation of a Section shall be considered an action or obligation of the Society as a whole. This By-Law shall be imprinted on any publication issued by the Section.

Par. 5 For the convenient conduct of its affairs, each Section shall organize an executive committee.

Par. 6 The affairs of the Local Sections shall be in general charge of the Standing Committee on Local Sections, under the direction of the Council.

Par. 7 The Council of the Society, on sixty (60) days' notice, may suspend or disband any Local Section.

Par. 8. There shall be a group meeting of Local Section delegates of each group preferably between October fifteenth and November fifteenth of each year at some central point within the geographical limits of the group.

Par. 9 Each Local Section shall be entitled to one voting delegate in the group meeting of Local Section delegates. In addition to such delegates the group representative serving his second year shall serve as chairman of the group meeting, but shall vote only in case of a tie.

Par. 10 At such group meeting of Local Section delegates, one representative shall be elected to represent the group for two (2) years at the conference of group representatives.

Par. 11 There shall be a conference of group representatives each year at the place and at the time of the Annual Meeting of the Society. There shall be sixteen (16) representatives to such annual conference, two (2) from each of the eight (8) groups, which groups shall conform geographically to those provided for in Article B7, Par. 3.

Article R11, Local Sections

Rule 1 When a number of members of the Society in any territory within the limits of North America, Hawaii, Puerto Rico and Cuba favor the formation of a Local Section in that territory, a preliminary meeting shall be called and notice sent to the entire membership of the Society residing in that territory. At this meeting a petition for the formaton of a Local Section, containing suggestions as to the territory to be included in the Section, may be presented, and, if adopted, shall be sent to the Standing Committee on Local Sections for recommendation to the Council.

Rule 2 Upon the approval by the Council of the petition, a meeting of the signers shall be held for the selection of a temporary executive committee of at least five (5) members. This committee shall have charge of, and be responsible for, the proceedings of the Local Section until the next election of officers.

Rule 3 The executive committee of a Local Section shall consist of a chairman, a secretary, and such other officers as may be found desirable. Such officers shall be elected by ballot of the members of the Society constituting the Section. The committee shall be elected before the first day of June each year and shall take office on the first day of July.

Rule 4 A member of the Society shall be entitled to vote or to hold office in not more than one (1) Local Section at a time.

RULE 5 The chairman of each Local Section shall have the privilege of attending all meetings of the Standing Committee on Local Sections.

RULE 6 The secretary of each Local Section shall report the proceedings of that Section to the Secretary of the Society for notice in the publications. He shall discharge the duties of secretary of the Section, and such other responsibilities as may be prescribed by the executive committee.

RULE 7 Any expenditure chargeable to the Society for the purpose of any Local Section must be provided for in the annual budget approved by the Council. No liability otherwise incurred shall be binding upon the Society.

RULE 8 Each Local Section shall use only such uniform stationery as is supplied by the Secretary of the Society.

RULE 9 For the convenient cooperation between the Local Sections and the Professional Divisions, each Local Section may appoint an individual or a committee to act as a correspondent with each Professional Division, with duties that will comprise generally the arranging with the Professional Division for the presentation of papers, holding of meetings, etc., within that particular Local Section, and as far as possible, to act as a means of furnishing information, secured within the Local Section, which might prove of interest to the Division.

RULE 10 A Local Section may affiliate with existing local engineering organizations, or form jointly with them new local engineering organizations, but the plan of such affiliation or organization, and the obligations assumed by the Local Section and the Society thereby, shall first be approved by the Council on recommendation of the Committee on Local Sections. Any expenditures incurred in such an affiliation shall be binding only on the Section and not on the Society as a whole.

RULE 11 A Local Section may arrange to hold joint meetings with other engineering organizations and may invite members of such organizations to attend its meetings, but all expenses incurred shall be binding only on the Section and not on the Society as a whole.

RULE 12 Each Local Section may adopt its own by-laws, for the conduct of its affairs, provided such are in harmony with the Constitution, By-Laws, and Rules of the Society, and provided also every publication of such by-laws be prefaced with a copy of this Rule.

RULE 13 Groups of members residing outside the limits of North America, Hawaii, Puerto Rico, and Cuba may engage in group activities with local members of the A.S.C.E., A.I.M.E., and A.I.E.E., in which case the Council may grant them nominal financial support, provided such group action is not in conflict with the policies and activities of any established national engineering societies in such foreign countries, and that such groups cooperate as permitted with such foreign societies.

ARTICLE C12, STUDENT BRANCHES

Sec. 1. The Council may authorize the organization of Student Branches which shall operate under the provisions of the Constitution, By-Laws, and Rules.

ARTICLE B12, STUDENT BRANCHES

PAR. 1 A Student Branch may be organized upon acceptance by the Council of the written request of at least fifteen (15) senior and junior students in any engineering school of accepted standing. Such a Branch shall be designated as the .... Student Branch of The American Society of Mechanical Engineers.

PAR. 2 The provisions of the Constitution, By-Laws, and Rules of the Society shall cover the procedure of all Student Branches, but no action or obligation of a Student Branch shall be considered an action or obligation of the Society as a whole. This By-Law shall be imprinted on any publication issued by the Student Branch.

PAR. 3 The function of the Standing Committee on Relations With Colleges under the direction of the Council shall be to organize, foster, and govern Student Branches and their activities.

PAR. 4 Annual regional conferences of delegates from Student Branches shall be held at the discretion of the Committee on Relations with Colleges.

ARTICLE R12, STUDENT BRANCHES

RULE 1 Upon the recommendation of a Student Branch, the President of the Society shall designate a corporate member of the Society as Honorary Chairman for one (1) year, to be a member ex officio of the governing body of the Student Branch.

RULE 2 Annually, each Student Branch shall select officers including a chairman and a governing body of at least three (3) Student-members.

ARTICLE C13, PUBLICATIONS AND PAPERS

Sec. 1. The papers and publications of the Society shall be issued in such manner as the Council may direct.

ARTICLE B13, PUBLICATIONS AND PAPERS

PAR. 1 All publications of the Society shall be in charge of the Standing Committee on Publications, under the direction of the Council.

PAR. 2 The publications of the Society shall consist of (*a*) the Transactions of the Society; (*b*) Mechanical Engineering; and (*c*) such other publications as the Council may direct.

PAR. 3 The policy of the Society shall be to give papers read before it the widest publicity.

PAR. 4 The Society shall not be responsible for statements or opinions advanced in papers or in discussion at meetings of the Society or of its Divisions or Sections, or printed in its publications.

PAR. 5 The Society reserves the right to copyright, at the discretion of the Council, any of its papers, discussions, reports, or publications.

ARTICLE C14, FUNDS

Sec. 1. The deposit, investment, and disbursement of all funds shall be subject to the direction of the Council.

ARTICLE B14, FUNDS

RECEIPTS

PAR. 1 All funds shall be paid in to the Secretary, who shall enter them in the books of the Society, and deposit them to the account of the Treasurer in a bank designated by the Council.

PAR. 2 All bills against members and others shall be made and collected by the Secretary.

PAR. 3 Income from initiation fees shall not be used for current expenses. At the close of each fiscal year, unless the Council then orders otherwise, this income shall be added to surplus.

PAR. 4 Funds may be solicited from sources outside of the Society for the conduct of research. All contributions to the Society for any specific purpose shall be disbursed under the direction of the Council.

PAR. 5 All gifts or bequests not designated for a specific purpose shall be invested and only the income shall be used.

PAR. 6 All gifts or bequests to the Society designated by the donors for a specific purpose, and all moneys permanently set aside by the Council for specific purposes, shall be invested and either the capital or income as so designated shall be used for that specific purpose for which it was designated.

PAR. 7 Except where otherwise definitely specified in a gift or bequest, the Secretary of the Society shall at the close of each fiscal year compute the interest and return received for the year on the Society's invested funds. The Secretary shall determine an average rate of income and shall recommend an apportionment of such return to each of the several funds for which investment is made. Upon approval and order of the Council these apportioned returns shall be duly entered in the books of account of the Society as the income for the year on the various funds.

PAR. 8 At the discretion of the Council income from any fund may be allowed to accumulate for expenditure in any subsequent year, or the income may be added to the original fund and invested with it. But in no case shall money be expended from such specially designated funds, either from capital or from income duly apportioned as detailed in paragraph 7, for the current expenses of the Society.

PAR. 9 Upon the maturity of any permanent investment the Treasurer shall reinvest such funds subject to approval by the Finance Committee and the Council.

PAR. 10 The securities of the Society, either principal or trust funds, may be sold, bought, or exchanged upon the written order of the Treasurer, the Secretary, and the Chairman of the

Finance Committee, and these three signatures must appear on any order to any broker, bank, or company. If any one or two of these officers be temporarily unavailable, then an equal number of members of the Executive Committee may be substituted.

Expenditures

Par. 11 All expenditures shall be made in accordance with the budget of appropriations as adopted by the Council.

Par. 12 Any obligations which may be incurred during the fiscal year and which will require the expenditure of the Society's funds outside of appropriations made by the Council shall first be referred to the Finance Committee for report by that Committee back to the Council.

Par. 13 The Secretary shall report to the Finance Committee each month the total expenditures incurred against each appropriation, together with the amount of each appropriation which is unexpended.

Par. 14 The annual appropriations approved by the Council, or so much thereof as may be required for the work of the Society, shall be expended by the Secretary, under direction of the committees.

Par. 15 All bills against the Society shall be in charge of the Secretary. Upon competent certification as to correctness and proper authorization, payment shall be made by the Secretary from the Cashier's Account.

Par. 16 The Treasurer shall reimburse the Cashier's Account for payments made therefrom only upon orders duly signed by the Secretary and the Chairman of the Finance Committee.

Article R14, Funds

Rule 1 The accounts of the Society shall be audited and approved annually by a chartered or other competent public accountant.

Rule 2 The Finance Committee shall hold monthly meetings for such business as shall come before it.

Rule 3 Each year the Finance Committee shall present with its report a detailed estimate of the probable income and expenditures of the Society for the following twelve (12) months.

Rule 4 Any contract or other obligations to pay money in the Society's work shall be valid only when signed by the Secretary.

Article C15, Professional Practice

Sec. 1. In all professional and business relations the members of the Society shall be governed by the Code of Ethics incorporated in the By-Laws.

Sec. 2. Any member who has violated the Constitution of the Society, or who is guilty of conduct rendering him unfit to remain a member, may be expelled by the vote of fifteen (15) members of the Council, after he has been given opportunity to be heard in his own defense.

Article B15, Professional Practice

Par. 1 All members of the Society shall subscribe to the following Code of Ethics, as required by the Constitution:

A Code of Ethics for Engineers

That the dignity of his chosen profession may be maintained, it is the duty of every engineer

1 To carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, and devotion to high ideals of personal honor.

2 To refrain from associating himself with, or allowing the use of his name by, any enterprise of questionable character.

3 To treat as confidential his knowledge of the business affairs or technical processes of clients or employers when their interests require secrecy.

4 To inform a client or employer of any business connections, interests, or affiliations which might influence his judgment or impair the disinterested quality of his services.

5 To accept financial or other compensation for a particular service from one source only, except with the full knowledge and consent of all interested parties.

6 To advertise only in a dignified manner, to refrain from using any improper or questionable methods of soliciting professional work, and to decline to pay or to accept commissions for work secured by such improper or questionable methods.

7 To refrain from using unfair means to win professional advancement and to avoid unfairly injuring another engineer's chances to secure and hold employment.

8 To cooperate in building up the engineering profession by the interchange of general information and experience with his fellow engineers and with students of engineering and also by contributions to the work of engineering societies, schools of applied science, and the technical press.

9 To interest himself in the public welfare and to be ready to apply his special knowledge, skill, and training in the public behalf for the use and benefit of mankind.

Article R15, Professional Practice

Rule 1 The Standing Committee on Professional Conduct, having in charge all matters connected with the Code of Ethics and its enforcement, shall cooperate with similar committees of other societies.

Rule 2 The Standing Committee on Professional Conduct shall follow the procedure below in considering cases presented to it:

(*a*) Cases for consideration may be:

(1) An interpretation of the code, or
(2) Rendering an opinion on the questionable conduct of a member of the Society.

(*b*) Cases and complaints are to be submitted to the Committee by the Secretary of the Society.

(*c*) Before a case is submitted to the Committee, the Secretary of the Society shall ascertain whether the person against whom a complaint has been made is a member of the Society, and if possible decide whether the case is of such importance as to be passed on by the Committee, or is of such a trivial nature that it can be handled by the Secretary.

(*d*) A case may be submitted by the Secretary of the Society either through the Chairman or jointly to each member of the Committee.

(*e*) On receipt of a case the Committee shall decide whether it can best make a finding by correspondence, or by a meeting of the Committee, and whether hearings shall be given to the interested parties.

(*f*) The Committee may appoint subcommittees to consider and report on cases too remote for the main Committee to act upon.

(*g*) All correspondence from members of the Committee should pass through the office of the Chairman of the Committee and not be sent direct to the Secretary of the Society. In order to facilitate filing and preparation of reports, a letter should cover only one case or subject.

(*h*) Reports and findings on cases shall be sent by the Chairman to the Secretary of the Society for consideration by the Executive Committee or Council of the Society, which may approve the findings or take such other action as may seem desirable or necessary.

(*i*) The Committee may, if it so desires, suggest action by the Executive Committee or Council.

(*j*) The Council shall have the power on recommendation of the Committee on Professional Conduct, either (1) to censure by letter the conduct of a member who has acted contrary to the Code, if the breach is of a minor character, or (2) to cause the member's name to be stricken from the rolls of the Society, as provided in C15, Sec. 2.

Article C16, Amendments to the Constitution

Sec. 1. At any Meeting of the Society any person entitled to vote may propose in writing an amendment to this Constitution, provided that it shall bear the written indorsement of at least twenty (20) corporate members in good standing.

Such proposed amendment shall not be voted on for adoption at that meeting, but shall be open to discussion and modification, and to a vote as to whether, in its original or modified form, it shall be mailed in printed form to the members of the Society for action.

If the members present at the meeting, not less than twenty (20) voting in favor thereof, shall so decide, then

the Secretary shall mail in printed form to each person entitled to vote, at least sixty (60) days previous to the next Meeting of the Society, a copy of the proposed amendment as so decided by said vote, accompanied by any comment the Council may elect to make.

A ballot shall be sent with the proposed amendment, and the voting shall be by sealed letter-ballot, closing at noon of the twentieth (20th) day preceding the meeting of the Society following the mailing.

The adoption of the amendment shall require a vote in its favor of two-thirds of the votes cast.

The Presiding Officer at the meeting of the Society following the close of the ballot shall announce the result, and if the amendment is adopted it shall thereupon take effect.

Sec. 2. Any changes in the order or numbering of paragraphs of the Constitution, By-Laws, and Rules required by an amendment shall be made under the direction of the Council.

Sec. 3. This Constitution shall supersede all previous rules of the Society, and shall go into effect upon the adjournment of the meeting of the Society at which the presiding officer announces its adoption.

Article B16, Amendments

Par. 1 At least fourteen (14) days before the closing of a ballot on an amendment to the Constitution, the President shall appoint three (3) Tellers whose duty it shall be to canvass the votes cast.

Par. 2 The Tellers shall canvass the ballots and shall certify the result to the Presiding Officer at the meeting of the Society at which the result is to be announced.

Par. 3 In the case of a tie vote on an amendment, the Presiding Officer at the Meeting of the Society shall cast the deciding vote.

Par. 4 The terms of office of the Tellers shall expire when their report of the canvass has been presented and accepted.

Par. 5 At any regular meeting, the Council may, by a two-thirds vote of its members present, adopt, or amend By-Laws in harmony with the Constitution, provided that such By-Laws or amendments shall have been submitted in writing at a previous meeting of the Council and the Secretary has mailed a copy to each member of the Council at least fifteen (15) days before the meeting at which action is to be taken. A By-Law or an amendment to a By-Law shall take effect immediately upon its adoption by the Council, and shall be published at once by the Secretary to all members of the Society.

Par. 6 At any regular meeting, by a majority vote of its members present, the Council may adopt or amend Rules in harmony with the Constitution and the By-Laws. A Rule or an amendment shall take effect immediately upon its adoption by the Council, and shall be published by the Secretary to all the members of the Society.

Article R16, Amendments

Rule 1 In voting on an amendment to the Constitution the voter shall prepare his ballot by crossing out that part of the amendment which he wishes to vote against. He shall then enclose the ballot in an envelope and seal it, and shall enclose this envelope in a second envelope marked "Ballot on Amendment" and seal it, and he shall then write his name thereon for identification.

Rule 2 The Tellers shall not receive any ballot after the stated time for the closure of the voting.

Rule 3 The Secretary shall certify to the competency and signature of all voters.

Rule 4 The Tellers shall open and destroy the outer envelopes and then open the inner envelopes and canvass the results.

Rule 5 A ballot without the autographic endorsement of the voter on the outside envelope is defective and shall be rejected by the Tellers.

Rule 6 The Tellers shall consider a ballot as valid provided the intent of the voter is clear, and provided also that he conforms with the regulations for voting.

Bridges, Luther W. ('15) (DKS), Mech. Engr., Design, Constr., Power Plants, Gas Works; *for mail*, 273 Union Ave., Framingham, Mass.
Bridges, Robert McStein (J'41), Mech. Engr., Vega Airplane Co., Burbank; *for mail*, 13171 Valley Vista Blvd., North Hollywood, Calif.
Bridgman, Robt. R. ('25; '34; '35) (AEM), Mech. Engr., Sterling Eng. Co., 1270 Niagara St., Buffalo; *for mail*, 190 S. Creek Rd., Hamburg, N.Y.
Briggs, Chas. B., Jr. (J'41), Mech. Engr., Prod. Dept., Kansas City Power & Light Co., 1330 Baltimore Ave.; *for mail*, 708 W. 48th St., Kansas City, Mo.
Briggs, Elmer J., Jr. (J'35), Power Plant Specialist, Engr., Civ. Aeronautics Authority, Capital Wallpaper Bldg.; *for mail*, 2423 Monroe, N.E., Washington, D.C.
Briggs, Fred, Jr. (J'37) (DJP), Equip. Engr., Colombian Petroleum Co., Apartado 100, Cucuta, Colombia, S.A.
Briggs, Kendal L. (J'36), c/o Catalin Corp., Fords, N. J.
Briggs, William C., Jr. ('34; '35) (CJM), Assoc. Mech. Engr., Fed. Works Agency, Public Bldgs. Admin., 7th & D Sts., S.W., Washington, D.C.; *for mail*, 710 N. Overlook Dr., Beverly Hills, Alexandria, Va.
Briggs, William S. (J'40), Supvr.. Charge Night Shift, E. I. du Pont de Nemours & Co.; *for mail*, 9 Cleveland Ave., Martinsville, Va.
Brigham, Ward E., Jr. (J'39) (ABM), Engr., Curtiss Propeller Div., Curtiss-Wright Corp., Caldwell, N.J.
Bright, G. Frank (J'41) (BES), 2305 Chester St., Little Rock, Ark.
Bright, Jas. R. (J'39) (ACS), *Charles T. Main Award*, '39; Test, Student Engr., Gen. Elec. Co., Schenectady, N.Y.; *for mail*, 16 Glyn Lane, St. Davids, Pa.
Brill, Geo. M. ('91; '96; F'36) (LRS), *Manager*, '04-'07; *Vice-President*, '10-'12; Cons. Engr., 19 Kingston Ave., Poughkeepsie, N.Y.
Brill, J. B. ('41) (ACL), Owner, Natl. Engrg. Co., 1030 E. 9th St.; *for mail*, 3916 Carrollton Ave., Indianapolis, Ind.
Brillhart, S. Edw. ('23; '31) (BJL), Mfg. Engr., West. Elec. Co., Inc., Point Breeze Works, Baltimore; *for mail*, Lincoln Ave., Lutherville, Md.
Brindel, Harold F. ('25) (CEP), Supt., Gasoline Plants, Gulf Oil Corp., Box 661, Tulsa, Okla.
Brindle, G. Ralph (J'35) (EFP), 1st Lt., 100th Coast Artillery (AA), Camp Davis, Hollyridge, N.C.
Briner, George F. (J'40) (ACM), Eng. Assembler, Jacobs Aircraft Eng. Co., Pottstown; *for mail*, Wernersville, Pa.
Bringhurst, G. Kendrick ('21; '27) (FKS), Mech. Engr., Stone & Webster Engrg. Corp., 49 Federal St., Boston; *for mail*, 877 Chestnut St., Waban, Mass.
Brinig, Frank G. ('37), Erie City Iron Works, Erie, Pa.
Brink, Wm. E. ('38) (CKL), Draftsman, Hills Bros. Co., 2 Harrison St., San Francisco; *for mail*, 6311 Contra Costa Rd., Oakland, Calif.
Brinley, C. Coapes ('37), Sales Engr., Lamson Corp., 211 Congress St.; *for mail*, 138 Beacon St., Boston, Mass.
Brinley, Charles E. ('13), Pres., Baldwin Loco. Works, Paschall P.O., Philadelphia, Pa.
Brinton, Willard C. ('07; '12), Cons. Engr., 36 W. 59th St., New York; *residence*, Albany Post Rd., Croton on the Hudson, N.Y.
Briscoe, Conway B. ('33; '39) (CMS), Engr., Charge Power Plants, City of St. Louis; *for mail*, 903 Bellerive St., St. Louis, Mo.
Briscoe, Ralph ('29) (CFS), Engr., Prod. Dept., Detroit Edison Co., 2000—2nd Ave., Detroit, Mich.
Bristol, Bennet B. ('18) (BCM), Treas., Foxboro Co.; *for mail*, 7 Howard Ave., Foxboro, Mass.
Bristol, Edward S. ('20; '25; '35) (FLS), Charge, Combustion Control Div., Engrg. Dept., Leeds & Northrup Co., 4901 Stenton Ave., Philadelphia, Pa.
Bristol, Howard H. ('13; '25), Pres., Bristol Co., Waterbury, Conn.
Bristol, Raymond W. ('19; '35) (G), Propr., Atlas Elec. Devices Co., 101 W. 31st St., New York, N.Y.
Britt, Wm. H. (J'36) (HKS), Asst. Ch. Engr., Buffalo Pumps, Inc., 874 Oliver St., North Tonawanda; *for mail*, 127 Dexter St., Tonawanda, N.Y.
Brittain, John R. ('22) (BTR), Mech. Engr., Charge Design, Los Angeles Ry. Corp., 401 E. 54th St., Los Angeles, Calif.
Britten, Clarence R. ('29), Plant Mgr., Monroe Calculating Mch. Co., 555 Mitchell St., Orange, N.J.
Brizzolara, R. D. ('27; '30) (CJR), Ch. Engr., Am. Steel Fdys., 410 N. Michigan Ave., Chicago, Ill.
Broadhead, Paul (J'40) (A), Asst. Engr., Engrg. Specialty Co., 718 Derby Ave., Oakland; *for mail*, 1232 Glen Ave., Berkeley, Calif.
Broas, Richard F. (J'40), Combustion Engrg. Co., 200 Madison Ave., New York, N.Y.; *for mail*, 182 N. Arlington Ave., East Orange, N.J.
Brobeck, Wm. M. (J'31) (AES), Research Assoc., Univ. of Calif.; *for mail*, 2983 Dwight Way, Berkeley, Calif.
Broberg, Orrin R. (J'36) (APR), Engr., Dept. 65, Plant 2, Vega Airplane Co.; *for mail*, 700 N. Lima St., Burbank, Calif.
Brock, Clarence A. ('13; '20; '26) (AKS), 17581 Indiana Ave., Detroit, Mich.
Brock, Frank Carter (J'41) (AES), Point View Pl., Mountain Lakes, N.J.
Brock, John E. (J'38) (BJS), Tech. Engr., Steam Engrg., Union Elec. Co. of Mo., Rm. 700, 315 N. 12th Blvd., St. Louis, Mo.
Brock, R. C. (J'35) (KLT), Asst. Engr., N. Am. Rayon Corp.; *for mail* 300 H St., Elizabethton, Tenn.
Brockel, Wm. E. (J'30) (CKS), Design Engr., Lummus Co., 420 Lexington Ave., New York, N.Y.; *for mail*, 28—20th Ave., Irvington, N.J.
Brocklebank, Arthur P. ('12) (HPS), Ch. Engr., Cameron Pump Div., Ingersoll-Rand Co., Phillipsburg, N.J.
Brockman, Fred W. (J'36), Westport Steam Sta., Consltd. Gas, Elec. Light & Power Co., Baltimore, Md.
Brockway, Willard Waldo (J'41), 845—15th St., Boulder, Colo.
Brockwell, Lloyd A. (J'41) (EKS), Training Course, Turbine Div., Westinghouse Elec. & Mfg. Co., Essington; *for mail*, 215 Haverford Ave., Swarthmore, Pa.
Broden, Edwin H. ('12) (BCJ), Mgr., Pittsburgh Dist., Am. Steel & Wire Co.; *for mail*, 132 Hawthorne St., Pittsburgh (18), Pa.
Broderick, Robt. E. (J'28) (CDW), Secy., Treas., Northeast. Lumber Mfrs. Assn., 271 Madison Ave., New York, N.Y.
Broders, Claude Owen (J'41), Draftsman, Pratt & Whitney Aircraft Div., United Aircraft Corp., 400 Main St.; *for mail*, 1617 Main St., East Hartford, Conn.
Brodin, Eric C. ('40) (BCM), Works Mgr., SKF Industries, Inc., Front St. & Erie Ave., Philadelphia; *for mail*, 209 Holmecrest Rd., Jenkintown, Pa.
Broeker, Fred'k G. ('17; '35) (BDM), Engr., Charge Shops & Fdys., Braden Copper Co., Rancagua, Chile, S.A.
Brogan, Joseph Edward (J'40) (CFS), Student Engr., Ill. Bell Tel. Co., 212 W. Washington; *for mail*, Y.M.C.A., Wilson Ave., Chicago, Ill.
Broghamer, Edw. L. (J'38) (BES), Assoc., Dept. of Mech. Engrg. (Mch. & Power Plant Design), Univ. of Ill., Rm. 110, Transportation Bldg., Urbana, Ill.
Brohl, Harry T. ('26; '35) (FKS), Supvg. Engr., Steam Serv., Westinghouse Elec. & Mfg. Co., Route 25 & Haynes Ave., Newark; *for mail*, 4 Mt. Vernon Rd., Upper Montclair, N.J.
Brombacher, Max H. C. ('21) (CER), Supt. of Properties, F.E.C. Hotel Co., Palm Beach, Fla.

Bronk, Arthur H. (J'39) (AE), Exper. Eng. Tester, Wright Aero. Corp., Paterson; *for mail,* 18 Liberty St., Bloomfield, N.J.
Bronson, Carlos E. ('15; '22), Ch. Mech. Engr., Kewanee Boiler Co., Kewanee, Ill.
Bronwick, Alex. I. (J'39), 5329—2nd St. N.W., Washington, D. C.
Brook, Victor ('37), 171 Rockingham St., Rochester, N.Y.
Brooke, Minott ('35) (FPS), Asst. Fuel Serv. Engr., Chesapeake & Ohio Ry. Co., Box 1800; *for mail,* 105 Fairfax Court, Huntington, W.Va.
Brooke, Wm. E. ('17), Prof., Head Math. & Mechanics, College of Engrg. & Arch., Univ. of Minn., Minneapolis, Minn.
Brookman, H. E. ('41), 404 Cottage Ave., Vermillion, S.D.
Brooks, C. P. ('41) (R), Mech. Engr., Erie R.R. Co., Midland Bldg.; *for mail,* 3104 W. Boulevard, Cleveland, Ohio.
Brooks, Chas. C. ('14) (DF), West. Mgr., Mead-Morrison Products, Robins Conveying Belt Co., Rm. 1575, 37 W. Van Buren St., Chicago, Ill.
Brooks, Chas. W. (J'35) (CEF), Reserve Officer, on duty in U.S.N.; *for mail,* West Road, Short Hills, N.J.
Brooks, Eugene A. ('18; '25) (DFS), Propr., Boiler Equip. Serv. Co., 686 Greenwood Ave., N.E., Atlanta, Ga.
Brooks, F. Warren (J'26) (CES), Engr., Cleveland Elec. Illum. Co., 75 Public Sq., Cleveland, Ohio.
Brooks, Frederick T. (J'36) (FLS), Asst. Mech. Engr., Burns & Roe, Inc., 233 Broadway, New York; *for mail,* 381 Bristol St., Brooklyn, N.Y.
Brooks, Fred'k A. ('18; '25; '29) (BEK), Agric. Engr., Calif. Agric. Exper. Sta.; *for mail,* R.F.D. Box 334, Davis, Calif.
Brooks, Henry W. ('18; '20) (CFS), Cons. Engr., 1300 McPherson Blvd., Fremont, Ohio.
Brooks, J. Ansel ('07; '11) (CDM), Prof. Indus. Engrg., Newark College of Engrg., 367 High St., Newark; *for mail,* 561 Park St., Montclair, N.J.
Brooks, Jas. G. (J'36), Dist. Mgr., Cleaver-Brooks Co., 30 Church St., New York, N.Y.
Brooks, Leo S. ('19; '35), Mech. Engr., Charge Maint., Sinclair Refining Co., 32nd & Kansas Ave.; *for mail,* 1426 S. 33rd St., Kansas City, Kan.
Brooks, Louis Edward (J'41) (CKS), 2160 Holland Ave., New York, N.Y.
Brooks, Morgan ('85; F'38) (AH), Life Member; Prof. Elec. Engrg., Emeritus, Univ. of Ill., Urbana, Ill.; *for mail,* 534 W. Magnolia Ave., San Antonio, Tex.
Brooks, Moses E. ('27; '31) (BHJ), Mem. of Staff, Ch. Mech. Engr., Aluminum Co. of Am., Gulf Bldg.; *for mail,* 3075 Eastmont Ave., Pittsburgh, Pa.
Brooks, Samuel A. ('29) (DFS), Mech. Engr., United Conveyor Corp., 37 W. Van Buren St., Chicago, Ill.
Brooks, William S. (J'40) (CES), Apt. 309, Drexel Hill Court, Drexel Hill, Pa.
Brootzkoos, Sergius D. ('21; '35) (BLM), Cons. Engr., 60 Wall St.; *for mail,* 782 West End Ave., New York, N.Y.
Bros, C. W. ('30; '35), V.P., Wm. Bros. Boiler & Mfg. Co.; *for mail,* 5336—1st Ave. S., Minneapolis, Minn.
Brose, Frederic M. (J'40) (BCP), Engr., Natl. Supply Co., Torrance; *for mail,* 12120 Laurel Terrace Dr., North Hollywood, Calif.
Brosius, Edgar E. ('18) (BHM), Pres., Edgar E. Brosius, Inc., 19th & P.R.R., Sharpsburg, Pa.
Brossart, John A., Jr. (J'36) (CJR), Plant Opera., Stand. Ry. Equip. Mfg., Co., New Kensington; *for mail,* 113 S. Highland Ave., Cheswick, Pa.
Brotzman, Irvin C. ('28; '35) (ACF), Asst. to V.P., Lone Star Cement Corp., 342 Madison Ave., New York, N.Y.
Broussard, Jos. (J'35), Chemist, Corn Products Refining Co., Argo; *for mail,* Route 2, Oak Lawn, Ill.
Brousseau, Edw. W. ('20; '25; '35), Installation & Serv. Div., RCA Mfg. Co., Inc., Camden, N.J.; *for mail,* Chestnut Hill Apts., Evergreen & Crefeld Sts., Chestnut Hill, Philadelphia, Pa.
Broward, Hoyt E. (J'41) (BEF), Allis-Chalmers Mfg. Co.; *for mail,* 1469 S. 73rd St., West Allis, Wis.
Browe, Ernest L. ('36) (EFL), Power Engr., United Engrs. & Constructors, Inc., 1401 Arch St., Philadelphia, Pa.
Brower, Jas. ('25) (BFS), Supt., Milwaukee Sewage Comm., Jones Island; *for mail,* 3021 N. 36th St., Milwaukee, Wis.
Brown, Albert ('22; '35) (FJS), Combustion Engr., Republic Steel Corp., Pine St.; *for mail,* 736 Hall Ave., N.W., Warren, Ohio.
Brown, Albert K. ('21; '25; '35), Engr., Riggs Distler & Co., Inc., 1518 Walnut St., Philadelphia; *for mail,* 7216 Brent Rd., Upper Darby, Pa.
Brown, Arthur Geo. ('84) (BK), Life Member; Mgr., Browns' Dryers (British) Ltd., Norton St., Greengate, Salford 3; *for mail,* Ellerslie, Oswald Rd., Chorlton-cum-Hardy, 21, Manchester, England.
Brown, Arthur L. ('17; '25) (BFH), Ch. Engr., Associated Factory Mutual Fire Ins. Cos., 184 High St., Boston, Mass.
Brown, Arthur L. (J'40) (CP), Shell Oil Co., Inc., 100 Bush St.; *for mail,* 2676 Pacific Ave., San Francisco, Calif.
Brown, Aubrey I. ('14; '21) (FKS), Prof., Htg. & Vent., Ohio State Univ., Columbus, Ohio.
Brown, Bertrand H. (J'39), Test Engr., Pratt & Whitney Aircraft; *for mail,* 351 Main St., East Hartford, Conn.
Brown, Bruce F. ('21) (CG), Mgr., So. Dist., Fibreboard Products, Inc., 4444 Pacific Blvd., Los Angeles, Calif.
Brown, Carl D. ('21; '24), Ch. Draftsman, Draper Corp.; *for mail,* 101 Dutcher St., Hopedale, Mass.
Brown, Carl F. (J'41) (ACJ), Matls. Engr., Glenn L. Martin Co., Baltimore; *for mail,* Morris St., Lutherville, Md.
Brown, Carl G. ('20; '26; '35), Silay-Hawaiian Central, Silay, Occidental Negros, P.I.
Brown, Cecil W. ('15; '35) (EFS), Dir. of Engrg., Conn. Power Co., 31 Union St., New London, Conn.
Brown, Chas. A. (A'24), Secy., Asst. Gen. Mgr., Lunkenheimer Co., P.O. Box 360, Annex Sta., Cincinnati, Ohio.
Brown, Chas. Ellsworth ('30) (FS), Assoc. Engr., Burns & McDonnell Engrg. Co., 107 W. Linwood, Kansas City, Mo.
Brown, Charles H. ('24) (BJM), Owner, Mgr., Brown Tool Co., Williams & Caddo Sts., Breckenridge, Tex.
Brown, Chas. Leonard (J'40) (BEH), Instr., Purdue Univ., Lafayette, Ind.
Brown, Clarence Blair, Jr. (J'41) (AEP), 3952 Cloverhill Rd., Baltimore, Md.
Brown, Clinton B. ('17; '35) (EKS), Ford, Bacon & Davis, Inc., 39 Broadway, New York, N.Y.; *for mail,* La Forge Cottages, Newport, R.I.

Busch, Frank ('32; '35) (BHM), Engr., Fraser-Brace Engrg. Co., 10 E. 40th St., New York; *for mail,* Chicago Ave., Massapequa, L.I., N.Y.
Buschmann, Paul T. (J'39) (DJM), Chem. Analyst, Am. Radiator & Stand. Sanitary Corp., Foot of E. 46th St., Bayonne; *for mail,* 62 Dana Pl., Englewood, N.J.
Busck, Paul G. ('35; '35), Asst. Ch. Draftsman, Lehigh Portland Cement Co.; *for mail,* 2750 Gordon St., Allentown, Pa.
Bush, Arthur (J'41) (ACM), Student Engr., Chrysler Corp.; *for mail,* 257 Colorado St., Highland Park, Mich.
Bush, George F. (J'40) (ABE), Asst. Prof. Mech. Engrg., Asst. to Dean, School of Engrg., George Washington Univ., Washington, D.C.
Bush, Harold M. ('94; '05), 2520 Clime Pike, R.F.D. 4, Sta. D., Columbus, Ohio.
Bush, R. T. (J'39) (BLS), Mech. Engr., Carbide & Carbon Chem. Corp., South Charleston; *for mail,* 1698 Piedmont Rd., Charleston, W.Va.
Bushey, Frank B. (J'41), 30—82nd St., Brooklyn, N.Y.
Bushfield, Frank T. (A'22), 46 Orchard Dr., East Williston, L.I., N.Y.
Bushley, Harry Richard ('26; '33; '35) (CRS), Dist. Mgr., Elliott Co., 1002 No. Life Tower Bldg., Seattle, Wash.
Bushman, William (J'41), 1012 Moreau Dr., Jefferson City, Mo.
Bushnell, Frederic N. ('91; F'37), *Manager*, '17-'20; Vice-Chmn., Bd. of Dirs., Stone & Webster Engrg. Corp., 49 Federal St., Boston; *for mail,* 20 Chapel St., Brookline, Mass.

Bushong, Robt. J. (J'39) (BGH), Engr., Marion Steam Shovel Co., W. Center St.; *for mail,* 247 Windsor St., Marion, Ohio.

Buss, C. A. (J'36), Mch. Designer, Baird Mch. Co., 1700 Stratford Ave.; *for mail,* 75 Fenelon Pl., Stratford, Conn.

Bussard, Benjamin F., Jr. (J'40) (CDL), Jr. Project Engr., Charles Lennig & Co., 5000 Richmond St.; *for mail,* 225 S. 37th St., Philadelphia, Pa.

Buswell, James M. ('30; '35) (HMS), Div. Safety & Fire Protection Engr., Pac. Gas & Elec. Co., San Joaquin Power Bldg., Fresno, Calif.

Butcher, Alfred ('24) (EFS), Steam Engr., Gulf Oil Corp., Pittsburgh, Pa.

Butcher, Ira A. ('18; '24) (CMS), Engr., U.S. Engrs., Bowman Field; *for mail,* Apt. 29, 1245 S. 4th St., Louisville, Ky.

Butcher, Joseph H. (J'35) (CLM), Safety Engr., Inspr., Aetna Casualty & Surety Co., 810 S. Spring St., Los Angeles; *for mail,* 2515 W. 81st St., Inglewood, Calif.

Butler, Clarence Albert, Jr. (J'40), Engr., Diamond Alkali Co.; *for mail,* 1009 Mentor Ave., Painesville, Ohio.

Butler, Ernest ('22; '35), Engr., Charge Design, Wayagamack Div., Consltd. Paper Corp., Ltd.; *for mail,* 530 St. Francois Xavier St., Three Rivers, Que., Can.

Butler, Frank A. ('19; '35) (EHM), Diesel Sales Dept., Fairbanks, Morse & Co., Marker & Corbin Sts.; *for mail,* 4136 Bryn Mawr St., Dallas, Tex.

Butler, Harry M. ('19), Mech. Engr., Union Twist Drill Co.; *for mail,* 95 Highland Ave., Athol, Mass.

Butler, Henry W. ('24) (FKS), Engr., Sanderson & Porter, 52 William St.; *for mail,* 150 E. 73d St., New York, N.Y.

Butler, Howard W. (J'40) (ABG), Instr., Applied Mechanics, Drawing, Mechanism, Univ. of Conn., Storrs; *for mail,* 168 Grandview Terrace, Hartford, Conn.

Butler, Jas. C. (J'36) (KRS), Estimator, Budget Dept., Combustion Engrg. Co., Inc., 1032 E. Main St.; *for mail,* 931 E. Terrace, Chattanooga, Tenn.

Butler, Jos. P. (J'36) (ABJ), Engr., Stress Analysis, Boeing Aircraft Co., Georgetown Sta.; *for mail,* 123—18th Ave., N., Seattle, Wash.

Butler, Leo Erwin (J'41) (W), Pulp & Paper Understudy, Kimberly-Clark Corp., Neenah; *for mail,* Kimberly, Wis.

Butler, Milton H. (J'39), Engr., Tex. New Mex. Utilities Co., 114 W. 7th St.; *for mail,* 1604 W. 7th St., Plainview, Tex.

Butler, Robert B. (J'37) (BCM), Sales Engr., Oliver Farm Equip. Sales Co., 4330 District Blvd., Los Angeles, Calif.

Butler, Robert M. (J'40) (E), Jr. Mech. Engr. (Diesel), U.S. Naval Engrg. Exper. Sta.; *for mail,* 117 Monticello Ave., Annapolis, Md.

Butrovich, Geo. W. ('34; '41) (AH), Hyd. Engr., Tulsa Plant, Douglas Aircraft Co., 111 W. 6th St.; *for mail,* Gen. Delivery, Tulsa, Okla.

Butt, Howard ('22; '23) (LPS), N.Y. Mgr., Engrg. & Export Dept., Wm. Powell Co., Rm. 288, 50 Church St., New York, N. Y.; *for mail,* Spring Brook Rd., Morristown, N.J.

Butterfield, Alan Gardner (J'35) (ELM), 196 Paterson St., Perth Amboy, N.J.

Butterfield, Thos. E. ('12), Prof. Heat Power Engrg., Lehigh Univ.; *for mail,* 204 E. Market, Bethlehem, Pa.

Butterworth, Harry Stanley (J'41) (ABH), Draftsman, Gen. Elec. Co., River Works, Lynn; *for mail,* 50 Broadway, Beverly, Mass.

Buttolph, Benj. G. ('05), V.P. Emeritus, Mfrs. Mutual Fire Ins. Co., P.O. Box 1485, 815 Grosvenor Bldg., Providence, R.I.

Buttron, W. C. ('36) (CRS), Asst. Supt., Constr. & Repairs, Mar. Dept., N.Y. Cent. R.R., Weehawken; *for mail,* 1258 Emerson Ave., West Englewood, N.J.

Butts, Edgar (J'41), Time Study, Aluminum Co. of Am., 5151 Alcoa Ave., Los Angeles; *for mail,* 6517 King Ave., Bell, Calif.

Buvinger, Geo. A. ('01; '04), Retired; 971 Harvard Blvd., Dayton, Ohio.

Buxton, Paul H. ('31) (BDS), Ch. Engr., West. Cartidge Co., East Alton; *for mail,* 702 Euclid Pl., Alton, Ill.

Buyers, Archie S. ('12; '25) (BC), Lt. Col., Ord. Dept., U.S.A., War Dept., Washington, D.C.; *for mail,* Picatinny Arsenal, Dover, N.J.

Bye, Norman C. ('27; '35) (CJW), Ch. Engr., Henry Disston & Sons, Inc., Tacony, Philadelphia, Pa.

Byer, Henry E. ('19), 21 State St., New York, N.Y.

Byerley, Thomas E. (J'41) (BHS), Draftsman, Ga. Power Co., 75 Marietta; *for mail,* 1084 Rosewood Dr., Atlanta, Ga.

Byers, Harry R. ('19; '25), Babcock & Wilcox Co., 444—17th St., Denver, Colo.

Bynum, Edwin A., Jr. ('20; '26; '35) (BPS), Ch. Engr., Ingleside Refinery, Humble Oil & Refining Co.; *for mail,* Box 512, Ingleside, Tex.

Byrne, Jas. J. (J'38) (BCJ), Jr. Engr. (Mech.). U.S. War Dept., Aberdeen Proving Ground; *for mail,* P.O. Box 351, Aberdeen, Md.

Byrom, Jas. L. ('23; '35), Process Engr., Natl. Carbon Co., W. 76th St., Cleveland, Ohio.

C

Cable, H. E. (J'37) (CRS), Mgr., Aluminate Chemicals Ltd., 555 Eastern Ave., Toronto, Ont., Can.

Caddy, William J. (J'40) (ACJ), Job Instr., Aeroplane Part Div., Briggs Mfg. Co., Conners St.; *for mail,* 5180 Parker Ave., Detroit, Mich.

Cadeau, Henry ('27), Mech. Supt., Stand. Francaise des Petroles, Notre-Dame-de-Gravenchon, Seine Inférieure, France.

Cadwallader, Harry, Jr. ('13), Pres., Stand. Shop Equip. Co., 82nd & Tinicum Ave.; *for mail,* 1413 W. Somerset St., Philadelphia, Pa.

Cadwallader, Lewis W. ('34; '41) (EFS), Watch Engr., Buzzard Point Plant, Potomac Elec. Power Co., Washington, D.C.; *for mail,* 609 Gist Ave., Silver Spring, Md.

Cady, Cecil I. ('22) (DEM), Cons. Mech. & Elec. Engr., 101 Park Ave., New York, N.Y.

Cady, Geo. H. ('29; '35) (MST), Plant Engr., Cranston Print Works, Cranston St., Cranston; *for mail,* 73 Roslyn Ave., Providence, R.I.

Cady, Harrison R. (J'16) (FHS), Mech. Engr., Hackensack Water Co., 4100 Park Ave., Weehawken; *for mail,* 367 Maitland Ave., West Englewood, N.J.

Cady, William G. (J'41), Test Engr., Worthington Pump & Mchy. Corp., Clinton & Roberts Sts.; *for mail,* Y.M.C.A., Buffalo, N.Y.

Cadzow, Murray ('21; '26) (AES), Mech. Engr., Fed. Works Agency, Pub. Bldgs. Admin., Washington, D.C.; *for mail,* 89-07—107th St., Richmond Hill, L.I., N.Y.

Cafiero, Dominick (J'40) (BCD), Prin. Engrg. Draftsman, Design Sec., Philadelphia Navy Yard, Philadelphia, Pa.; *for mail,* 2 Lorraine Ave., Mt. Vernon, N.Y.

Cagin, Harry (J'36), Die Designer, Superior Die Casting Co., 17325 Euclid Ave.; *for mail,* 12530 Edmonton Ave., Cleveland, Ohio.

Cahill, Edw. H. ('14; '18), 703 Beechwood Dr., Beechwood, Upper Darby P.O., Pa.

Cahill, John E. ('18; '35), Partner, John E. Cahill Co., 342 Madison Ave., New York, N.Y.

Cain, Basil S. ('35) (ABR), Asst. Engr., Loco. Div., Gen. Elec. Co., East Lake Rd., Erie, Pa.

Caine, Wm. P. ('99; '04; '18) (FJS), Retired; 2215 Ave. H, Ensley Sta., Birmingham, Ala.

Cala, Chas. F. (J'34), Foreman, Charge Glass Making, Bausch & Lomb Optical Co., 635 St. Paul St.; *for mail,* 144 Hoover Rd., Rochester, N.Y.

Calamari, Peter L. (J'34), 660 Rockefeller Bldg., Cleveland, Ohio.

Calder, Augustus W., Jr. ('32; '38) (CJM), Asst. Mgr., Asst. Treas., New England Butt Co., 304 Pearl St.; *for mail,* 184 Angell St., Providence, R.I.

Caldwell, Eugene ('28; '33) (CDM), Gen. Mgr., Willamette Hyster Co., 2902 N.E. Clackamas St., Portland, Ore.

Caldwell, Eugene C. (J'41), Asst. Engr., Frederick Stearns & Co., 6533 E. Jefferson Ave., Detroit; *for mail,* 1011 Maryland Ave., Grosse Pointe, Mich.

Caldwell, Wm. E. ('18; '22; '26) (EFS), *Melville Medallist,* '33; Mech. Plant Engr., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York, N.Y.

Calkin, E. D. (J'33) (BCM), Owner, Mgr., Elf Eng. Co., 3055 N.E. Everett St., Portland, Ore.

Calkins, George B., Jr. (J'40), Ensign, U.S.N.R., U.S.S. *PC-471,* c/o Postmaster, New York, N.Y.

Call, A. E. ('17; '20), Mgr., Island Creek Coal Co., 1520 Central Natl. Bank Bldg., Richmond, Va.

Call, Leroy J. ('21) (DMS), Constr. Engr., Carborundum Co., Buffalo Ave; *for mail,* 925 Maple Ave., Niagara Falls, N.Y.

Callahan, Jos. G. ('22; '26), Prod. Supt., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York, N.Y.

Callahan, Vincent T. ('30), Reserve Power Plant Engr., Bell Tel. Labs., Inc., 463 West St., New York, N.Y.; *for mail,* Lauvir Court, 143 Tenafly Rd., Englewood, N.J.

Callahan, Wm. J. (J'34) (BFS), Asst. Engr., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York; *for mail,* 302 Marine Ave., Brooklyn, N.Y.

Callan, John ('18; '22; '35) (FS), Supt., Power Dept., Tenn. Eastman Corp., Kingsport, Tenn.

Callaway, Clarence R. ('21) (BCM), 120 Cabrini Blvd., New York, N.Y.

Callaway, Robert S. (J'40) (CDJ), Jr. Indus. Engr., Am. Steel & Wire Co., P.O. Box 40, Morgan Park Sta.; *for mail,* 8506 Beverly St., Duluth, Minn.

Calmus, F. A. ('27; '35) (KPS), Pac. Coast Mgr., Elliott Co., 813 Rialto Bldg., San Francisco, Calif.

Calnan, Edw. J. ('30; '38) (FKS), Power Engr., Ont. Paper Co., Ltd., Thorold, Ont., Can.

Calvet, Albert Marcel (J'40) (AKS), Draftsman, Designer, Babcock & Wilcox Co.; *for mail,* 573 Orchard Ave., Barberton, Ohio.

Edwards, Frank W. ('41) (ABH), Sr. Hyd. Engr., The Panama Canal; *for mail*, Box 197 Diablo Heights, C.Z.

Edwards, G. Middleton ('16; '25; '35), Ch. Draftsman, Kent Mch. Works, Inc., 39 Gold St., Brooklyn, N.Y.; *for mail*, 368 Hilltop Ave., Leonia, N.J.

Edwards, Gilbert E. (J'39) c/o Ocean Accident & Guarantee Corp., Employers Liability Bldg., 33 Broad St., Boston, Mass.

Edwards, Harry D. ('18) (EKS), Works Engr., Linde Air Products Co., 30 E. 42nd St., New York, N.Y.

Edwards, Henry Harmon ('16; '26), New Departure Div., Gen. Motors Corp., Bristol, Conn.

Edwards, Henry Hartley (J'36), Aeroil Burner Co., 13th St. & Park Ave.; *for mail*, 6607 Broadway, West New York, N.J.

Edwards, Howard B. (J'36) (ABM), Jr. Engr., Cutter Dept., Gleason Works, 1000 University Ave.; *for mail*, 458 Hillside Ave., Rochester, N.Y.

Edwards, Leonard Harden (J'41) (DFJ), Bethlehem Steel Co., Lackawanna; *for mail*, 128 Harding Rd., Buffalo, N.Y.

Edwards, Robert W. (J'40) (CLM), Process Devel. Engr., Bausch & Lomb Optical Co., St. Paul Blvd.; *for mail*, 178-80 Meigs St., Rochester, N.Y.

Edwards, William Rowland (J'38) (BEP), Jr. Project Engr., Refining Dept., Humble Oil & Refining Co., Box 95; *for mail*, P.O. Box 94, Ingleside, Tex.

Edwards, Wm. Westley ('13; '17; '35) (AES), Prof. Heat Engrg., Wentworth Inst., 550 Huntington Ave., Boston; *for mail*, 16 Regent St., West Newton, Mass.

Effross, Max P. ('35) (BDL), Ch. Draftsman, Natl. Sugar Refining Co., 203—35th Ave., Long Island City; *for mail*, 266 Washington Ave., Brooklyn, N.Y.

Egan, Edward F. (J'40) (CKL), Draftsman, J.O. Ross Engrg. Corp., 350 Madison Ave., New York, N.Y.; *for mail*, 136 Highgate Terrace, West Englewood, N.J.

Egan, Kyran Wm. ('28; '35), Safety Inspc., Constr., State Dept. of Labor, 80 Center St., New York; *for mail*, Box 159, R.F.D. 1, Schenectady, N.Y.

Egbert, Chas. C. ('06) (EHS), Cons. Engr., 404 Jefferson Ave., Niagara Falls, N.Y.

Egbert, Harry E. (J'39) (ACM), Asst. Supt., Maint., Boeing Aircraft Co., Georgetown Sta.; *for mail*, 5501—11th Ave., N.E., Seattle, Wash.

Eger, George W., Jr. (J'40) (BCF), Engrg. Trainee, Caterpillar Tractor Co., Washington St.; *for mail*, 204 Pekin Ave., East Peoria, Ill.

Eggebrecht, Edward T., Jr. (J'40) (CJM), Prod. Supvr., Pullman Stand. Car Mfg. Co.; *for mail*, 429 Detroit St., Hammond, Ind.

Eggert, Erwin H. ('29; '36) (DFL), Mech. Engr., Procter & Gamble Mfg. Co., Ivorydale; *for mail*, 3629 Solar Vista, Cincinnati, Ohio.

Eggleston, Herbert L. ('28) (CLP), *Manager, '41-'44*; Mgr., Gas & Refining Depts. Gilmore Oil Co., 2423 E. 28th St., Los Angeles; *for mail*, 1017 Cumberland Rd., Glendale, Calif.

Egilsrud, Fridtjof S. ('24; '25; '35) (AFS), Head, Mech. Engrg. Lab. Dept., Pratt Inst., Brooklyn, N.Y.

Egleston, Marvin P. (J'33) (BDS), Draftsman, Am. Smelting & Refining Co.; *for mail*, Garfield, Utah.

Egleston, O. J. ('16), Hotel Utah, Salt Lake City, Utah.

Egli, Adolf ('38) (BKS), Devel. Engr., Sulzer Bros., Ltd., Winterthur, Switzerland.

Egli, H. ('41) (FHS), Cons. Mech. Engr., Egli & Gompf, Inc., 425 St. Paul Pl., Baltimore; *for mail*, 407 S. Rolling Rd., Catonsville, Md.

Egry, C. Robert ('40) (BCD), Assoc. Prof. Mech. Engrg., Univ. of Notre Dame; *for mail*, 1017 E. Washington Ave., South Bend, Ind.

Ehbrecht, Adolf ('30; '36) (ACM), V.P., Secy., Gries Reproducer Corp., 463 E. 133rd St., New York; *for mail*, 186 Weyman Ave., New Rochelle, N.Y.

Ehlers, Henry Edward ('12) (EHS), V.P., Day & Zimmermann, Inc., Packard Bldg.; *for mail*, 2031 Locust St., Philadelphia, Pa.

Ehlinger, Arnold H. (J'41) (ABH), Engineer's Asst., Blower & Compressor Dept., Allis-Chalmers Mfg. Co.; *for mail*, 613 N. 17th St., Milwaukee, Wis.

Ehmann, Roy Leon ('38) (FKS), Sales Engr., Combustion Engrg. Co., Inc., 1507—1st Natl. Bank Bldg., Pittsburgh; *for mail*, 469 Willow Dr., Mt. Lebanon, Pa.

Ehrenburg, Hillebrand Hendrik ('28) (S), Managing Dir., Twentsch Centraal Station voor Electrische Stroomlevering N.V., 103 Enschedeschestr., Hengelo, Overijsel, Netherlands.

Ehrhart, Geo. W. (J'33), Fluor Corp., Ltd., Los Angeles; *for mail*, 3246 Live Oak St., Huntington Park, Calif.

Ehrich, Louis S., Jr. (J'37), Draftsman, George G. Sharp, 30 Church St.; *for mail*, 215 W. 23rd St., New York, N.Y.

Ehrman, Bruno, Jr. (J'37) (C), Prod. Control Engr., Keuffel & Esser Co., 300 Adams St., Hoboken; *for mail*, 145 N. Leswing Ave., Rochelle Park, N.J.

Eiben, Lawrence A. (J'41) (CHJ), Gen. Mgr., No. Blower Co., 6409 Barberton Ave., Cleveland, Ohio.

Eibsen, Louis J. ('19) (DEH), Mech. Engr., Equip. & Design, Mason & Hanger Co., 500—5th Ave., New York; *for mail*, 3 Burleson Ave., Ellenville, N.Y.

Eigenbrot, John L. ('21) (EFS), Asst. to Pres., Gen. Coal Co., 123 S. Broad St., Philadelphia, Pa.

Einfeldt, Charles L. ('29; '35) (CHS), Piping Design Engr., Detroit Edison Co., 2000—2nd Ave.; *for mail*, 5347 Allendale Ave., Detroit, Mich.

Einig, Alvin B. ('12; '21; '35) (BCM), Gen. Mgr., Motch & Merryweather Mchy. Co., 715 Penton Bldg., Cleveland; *for mail*, 2592 Dartmoor Rd., Cleveland Heights, Ohio.

Einstein, Sol ('13) (BCM), V.P., Cincinnati Milling Mch. Co., Oakley, Cincinnati, Ohio.

Eiserman, Fred'k J. ('29), Mch. Design Engr., Dexter Folder Co.; *for mail*, 205 Ridge St., Pearl River, N.Y.

Eiskamp, Edward ('41) (JAM), Acting Supvr., Inspr., War Dept., 43 Hall St., Brooklyn; *for mail*, 10753—120th St., Richmond Hill, L.I., N.Y.

Eisler, Chas. ('17; '19), Mech. Engr Propr., Eisler Engrg. Co., 750 S. 13th St., Newark, N.J.

Eisler, Chas., Jr. (J'40), 16 Hoffman St., Maplewood, N.J.

Eisnor, Judson B. (J'40) (GMW), Jr. Engr., New England Tank & Tower Co., 85 Tileston St.; *for mail*, 36 Waverly Ave Everett, Mass.

Eister, Wm. D. (J'34) (CLS), Air Force Combat Command, Bolling Field, Anacostia, D.C.

Ek, Alma ('17; '22), Ch. Engr., La Luz Mines Ltd., Siuna via Puerto Cabezas, Nicaragua, C.A.

Ek, Gustaf C. ('22; '35), Traveling Engr., Great West Sugar Co., Sugar Bldg.; *for mail*, 1550 Magnolia St., Denver, Colo.

Eklund, Joel ('25) (BFK), Mech. Designing Engr., Chem. Constr. Corp., 30 Rockefeller Plaza, New York; *for mail*, 54 Mountain Ave., New Rochelle, N.Y.

Eksergian, C. L. ('24; '34), Ch. Engr., Budd Wheel Co., 12141 Charlevoix Ave., Detroit, Mich.

Eksergian, Rupen ('21; F'40), *Worcester Reed Warner Medallist*, '39; Edw. G. Budd Mfg. Co., Philadelphia; *for mail*, Rose Tree Rd., Media, Pa.

Eland, Frank H. ('30; '35) (DJM), Ch. Engr., Dodge Mfg. Div., United Steel Corp., 58 Pelham Ave., Toronto, Ont., Can.

Elberson, Leander P. ('16), Ch. Engr., La. Irrigation & Mill Co.; *for mail*, Box 35, Crowley, La.

Elder, John D. ('28), Ch. Engr., Crown Cork & Seal Co., Highlandtown, Baltimore; *for mail*, Montrose Ave., Catonsville, Md.

Elder, Norman James (J'41) (ABM), 74 W. Miller Ave., Akron, Ohio.

Eldert, John DeBevoise ('31; '38) (DMT), Ch. Engr., Asst. Mgr., Mch. Parts Corp., 271 Washington St., Providence, R.I.

Eldred, Byron E. ('99; '03), Chateau Brittany Apts., Scarsdale, N.Y.

Eldredge, A. H. ('94) (AE), Retired: 74 Laurel St., Melrose, Mass.

Eldridge, Charles Douglas (J'37) (CDM), Indus. Engr., Tube Turns, Inc., 224 E. Broadway; *for mail*, 804 S. 39th St., Louisville, Ky.

Eley, Robt. V. ('23; '27) (MR), Mchy. Buyer, Ford Motor Co., 3700 Shaeffer Rd., Dearborn; *for mail,* 17315 Northlawn Ave., Detroit, Mich.
Elfring, John B. ('20; '35), Mech. Engr., Cincinnati Milling Mch. Co., Oakley; *for mail,* 5029 Anderson Pl., Cincinnati, Ohio.
Elias, Bert F. (J'40), c/o Bailey Meter Co., 2512 Carew Tower Bldg., Cincinnati, Ohio.
Elkins, Douglas A. (J'38) (BJM), Asst. Mech. Engr., Metallurgical Div., U.S. Bur. of Mines, 1600 E. 1st South; *for mail,* 1875 E. 21st South, Salt Lake City, Utah.
Elkus, James H. (J'33) (ACD), Indus. Engr., Blaw-Knox Co.; *for mail,* 4000—5th Ave., Pittsburgh, Pa.
Ell, Carl S. ('21) (C), Pres., Northeast. Univ., 360 Huntington Ave., Boston, Mass.
Ellenberger, F. Richard (J'40) (ABG), Student Engr., Gen. Elec. Co., 1 River Rd., Schenectady; *for mail,* Box 153, Ballston Lake, N.Y.
Ellenberger, Wm. J. ('34; '41) (CES), Power Sales Engr., Potomac Elec. Power Co., 10th & E Sts., N.W.; *for mail,* 6524 Luzon Ave., N.W., Washington, D.C.
Ellenwood, Frank O. ('13) (EFK), John Edson Sweet Prof. of Engrg., Cornell Univ.; *for mail,* 111 Harvard Pl., Ithaca, N.Y.
Ellery, Donald E. (J'39), Training, Remington Arms Co., Bridgeport; *for mail,* 9 Stiles St., Stratford, Conn.
Ellicott, Chas. Remington ('16) (R), V.P., Westinghouse Air Brake Co., 350—5th Ave., New York, N.Y.
Ellingwood, Elliot L. ('18), Cons. Mech. & Elec. Engr., Rm. 700, 124 W. 4th St., Los Angeles, Calif.
Elliot, Augustus Hull ('14; '35) (JKR), V.P., So. Wheel Div., Am. Brake Shoe & Fdy. Co., 230 Park Ave., New York, N.Y.
Elliot, Walter R. (J'41) (EFK), Asst. Prof., Univ. of Mo., Columbia, Mo.
Elliott, Ben G. ('11; '16; '23) (EFS), Prof. Mech. Engrg., Univ. of Wis; *for mail,* 2302 Commonwealth Ave., Madison, Wis.
Elliott, Clifton M. (J'38) (AHM), Research Engr., Chrysler Corp., 12800 Oakland Ave.; *for mail,* 240 McLean Ave., Highland Park, Mich.
Elliott, E. G. ('07), 5033—4th Ave., Los Angeles, Calif.
Elliott, Edw. ('21) (ABR), Asst. Prin. Engr., Pullman Stand. Car Mfg. Co., 27 Mountain St., W.; *for mail,* 6 Devens Rd., Worcester, Mass.
Elliott, Edw., Jr. (J'36) (EJP), East. Sales Rep., Pressed Steel Tank Co., 52 Vanderbilt Ave., New York, N.Y.
Elliott, James E., Jr. (J'40) (JMS), Draftsman, Ingalls Shipbldg. Corp., Pascagoula; *for mail,* P.O. Box 1, Ocean Springs, Miss.
Elliott, John M. (J'41) (AEM), Rm. 113, Bldg. 701, Naval Air Sta., Jacksonville, Fla.
Elliott, Louis ('23) (EFS), Cons. Mech. Engr., Ebasco Services, Inc., 2 Rector St., New York, N.Y.
Elliott, Milton D. (J'40), Jr. Gear Engr., Dodge Plant, Chrysler Corp.; *for mail,* Hannan Memorial Y.M.C.A., Detroit, Mich.
Elliott, Newton R. ('17; '35) (BGM), Draftsman, Asst. Engr., City of South Portland, Me., 25 Cottage Rd.; *for mail,* 41 Lowell St., South Portland, Me.

Grant, Taylor B. ('23; '35) (CJM), Supvr., Bell Tel. Labs., Inc., 463 West St., New York; *for mail,* 99-41—65th Rd., Forest Hills, L.I., N.Y.
Grant, William W. ('35; '35) (C), Dir., Marketing Research, Westinghouse Elec. & Mfg. Co.; *for mail,* Glendale Blvd., R.D. 5, Mansfield, Ohio.
Grantz, Howard E. (J'39) (ABH), Mech. Design, Airplane Cabin Superchargers, Gen. Elec. Co., 920 Western Ave., Lynn; *for mail,* 282 Puritan Rd., Swampscott, Mass.
Graser, Theodore Nestor ('38) (CHS), Treas., Co-Mgr., Cochrane Steam Specialty Co., 80 Federal St., Boston, Mass.
Grasse, Harold (J'37) (EFS), Mech. Engr., Black & Veatch, Cons. Engrs., 4706 Broadway, Kansas City, Mo.
Grassi, Raymond C. (J'41) (BCM), Tool Designer, Merco Nordstrom Valve Co., 2431 Peralta St.; *for mail,* 3831 Park Blvd., Oakland, Calif.
Grassi, Robert N. (J'41) (BCS), c/o Ware, 1019 Ross Ave., Wilkinsburg, Pa.
Graswicz, Edward (J'41) (ACM), 58 Princeton St., Medford, Mass.
Gratz, Dehaven (J'37), Student Engr., Allis-Chalmers Mfg. Co.; *for mail,* 1516 S. 76th St., West Allis, Wis.
Gravenstreter, H. R. ('37), M.M., Shenango Works, Carnegie-Ill. Steel Corp., New Castle, Pa.
Graves, Benj. P. ('23) (HJK), Dir. of Design, Brown & Sharpe Mfg. Co., Providence, R.I.
Graves, Edwin H. (J'39), Halifax Paper Co.; *for mail,* Patterson Apts. 6, Roanoke Rapids, N.C.
Graves, Geo. R. ('28; '35) (FPS), Oper. Engr., Fla. Power & Light Co., Dania; *for mail,* P.O. Box 733, Ft. Lauderdale, Fla.
Graves, Walter J. ('17) (CDW), Indus. Engr., Mich. Mutual Liability Co., 163 Madison Ave.; *for mail,* 16811 Ferguson Ave., Detroit, Mich.
Gray, Chas. J. (J'39) (MRS), Spec. Apprentice, Mech. Dept., Atlantic Coast Line R.R. Co.; *for mail,* 309 N. 16th St., Wilmington, N.C.
Gray, David R. ('30; '36), Mech. Engr., Charge Maint., Diamond Match Co., Box 1483, Spokane, Wash.
Gray, Ellsworth S. ('37) (EFK), Assoc. Prof. Mech. Engrg., College of Engrg., Univ. of Mo., Columbia, Mo.
Gray, Fred'k R. ('22), Supt., Engrg. Div., Westinghouse Elec. & Mfg. Co., 40 Wall St., New York, N.Y.
Gray, Guy M. ('35) (CER), Supt. of M.P., Bessemer & Lake Erie R.R. Co., Greenville, Pa.
Gray, H. Liggett ('16; '25; '35) (AER), Asst. Mgr., Oakite Products, Inc., 22 Thames St., New York, N.Y.
Gray, Harry ('28), Mech. Engr., Charge Maint., Gen. Supt., Charge Operas., Sternberg Dredging Co., 26 Marine Bldg., Galveston, Tex.
Gray, Henry C. (J'17), Instr., Mch. Design, Rose Poly. Inst., Terre Haute, Ind.
Gray, Howard H. (J'39), Jr. Detail Draftsman, Lockheed Aircraft Corp.; *for mail,* 627 N. Elmwood Ave., Burbank, Calif.
Gray, John B., III (J'40) (BCD), 2nd Lt. (Platoon Comdr.), Co. B, 5th Engrs., Ft. Belvoir, Va.; *for mail,* Prince Frederick, Md.
Gray, John W. ('95; '26) (CFS), Retired; 226 Windermere Ave., Wayne, Pa.
Gray, Newenham A. ('30) (BJL), Cons. Engr., 103 McIndoe St., Wausau, Wis.
Gray, Percy S. (J'35) (CDM), Asst. Mgr., H. S. Gray Co., 74 S. Queen St., Honolulu, T.H.
Gray, Robert L. (J'41) (CJP), Tester in Lab., Ashland Oil & Refining Co., Ashland; *for mail,* 105—28th St., Catlettsburg, Ky.
Gray, Thos. C. ('39) (BRS), Ch. Engr., Franklin Railway Supply Co., Inc., 60 E. 42nd St., New York, N.Y.
Gray, Vernon H. (J'39) (AGJ), Loop Course Student, Bethlehem Steel Co., Lackawanna; *for mail,* 52 Eaglewood Ave., Buffalo, N.Y.
Gray, Wharton K. ('28; '31; '35) (CDL), Ch. Engr., Spreckels Sugar Co., 2 Pine St., San Francisco, Calif.
Gray, William E. ('36) (BMR), Engr., Draft Gear Tests, Purdue Univ., Lafayette; *for mail,* 479 Maple St., West Lafayette, Ind.
Graybeal, Herbert Lee (J'40) (BJW), Asst. Ord. Engr., Navy Yard, Mare Island; *for mail,* 58 B St., Vallejo, Calif.
Greacen, Walter, III ('37), E. M. Gilbert Engrg. Corp., 412 Washington St.; *for mail,* 2610 Hollywood Court, Mt. Penn, Reading, Pa.
Greagan, John J. ('17; '21) (CHS), Dist. Mgr., Allis-Chalmers Mfg. Co., 1303-4 1st Natl. Bldg., Birmingham, Ala.
Greaves, Fred G., Sr. ('25; '35) (DJL), Ch. Engr., Seattle-Tacoma Shipbldg. Corp., 2400—11th St., S.W.; *for mail,* 2015—35th Ave., W., Seattle, Wash.
Greaves, W. A. ('23) (BLM), Engr., Struthers-Wells Co., Warren, Pa.
Grebe, John J. ('30; '34) (ALP), Dir., Physical Research Lab., Dow Chem. Co., Midland, Mich.
Greeley, Chas. E. (J'37) (CEK), Asst. Engr., Bur. of Ord., Navy Dept., Washington, D.C.
Greeley, Mark S. (J'34), Design Engr., Continental Gin Co., 4400—5th Ave., South Birmingham, Ala.
Green, Andrew S. (J'36) (AEH), Naval Arch., Navy Dept., Mare Island; *for mail,* 1144 Nebraska St., Vallejo, Calif.
Green, Arthur B. ('22) (CLW), Treas., Paprex Co., 24 Water St., Wakefield, Mass.
Green, Ben H. ('21; '35) (CKS), Supt., Steam Stas., Cent. N.Y. Power Corp., P.O. Box 418; *for mail,* 230 E. 7th St., Oswego, N.Y.
Green, Boynton M. ('21; '35) (BJM), *Student Award,* '16; Prof. Mech. Engrg., Stanford Univ.; *for mail,* 691 Salvatierra St., Stanford Univ., Calif.
Green, Charles E. (J'41) (CJS), Tungsten, Colo.
Green, Clarence R. (J'37), Jr. Engr., Power Plant, Detroit Edison Co., 6603 W. Jefferson, Detroit; *for mail,* 4724 Orchard St., Dearborn, Mich.
Green, Edward O. (J'40), 221 W. 18th St., North Little Rock, Ark.
Green, Fred'k W. ('13) (BRS), Ch. Oper. Officer, St. Louis Southwest Ry. Lines, 515 Cotton Belt Bldg., St. Louis, Mo.
Green, George C. ('34; '41) (DKL), Mech. Engr., Bakelite Corp., Bound Brook; *for mail,* 26 E. Cliff St., Somerville, N.J.
Green, Heatley ('19), Pres., Automatic Products Co., 1145 W. Grand Blvd., Detroit, Mich.
Green, John ('41) (BMT), Plant Engr., Proximity Print Works; *for mail* 3509 Delancey St., Bessemer Branch, Greensboro, N.C.
Green, John S. ('37) (CJM), Works Mgr., Johnston & Jennings Co., 877 Addison Rd., Cleveland, Ohio.
Green, Lewis Edwards (J'39) (DMS), Asst. Engr. Design., Prod. Maint., Uniflow Mfg. Co., E. Lake Rd., Erie; *for mail,* 2288 Eastern Ave., Wesleyville, Pa.
Green, Lorn A. ('24; '28; '35) (CEP), Mgr., Ingersoll-Rand Co., 1460 E. 4th St., Los Angeles, Calif.
Green, Robert J. (J'35) (ACE), Engr., Am. Hammered Piston Ring Div., Koppers Co., Bush & Hamburg Sts., Baltimore, Md.
Green, Thomas A. ('41), Design Engr., Bailey Meter Co., 1050 Ivanhoe Rd., Cleveland; *for mail,* 2552 Kingston Rd., Cleveland Heights, Ohio.
Green, Truman Jos. (J'38) (CEH), City Engr., City of Spur, Spur, Tex.
Green, Walter L. ('26; '35), V.P., Gen. Mgr., Seattle Tacoma Shipbldg. Corp., Tacoma, Wash.
Green, Wm. (27; '35) (JMS), Head Master, Ironworkers Trade Sch., Education Dept. of South Australia; *for mail,* 12 Shipster St., Torrensville, South Australia.
Green, Wm. O. ('91), Partner, Ogden, Sheldon & Co., 30 N. LaSalle St., Chicago, Ill.
Green, Wm. T. (J'40) (ADJ), Liaison Engr., Vega Airplane Co., Burbank; *for mail,* 1002 N. Mariposa Ave., Los Angeles, Calif.
Green, Wilson P. (J'32), Asst. Prof. Mech. Engrg., Univ. of Md.; *for mail,* 6900 Dartmouth Ave., College Park, Md.
Greenawalt, Russell F. (J'34) (HKL), Snider Packing Corp., 40 Franklin St., Rochester, N.Y.
Greenberg, J. H. (J'41), Asst. Engr., Perfection Gear Co., Harvey; *for mail,* 5131 University, Chicago, Ill.
Greenberg, Morris ('40), Bailey Meter Co., 140 S. Dearborn St., Chicago, Ill.
Greenberg, Sidney (J'34) (AHS), Asst. Engr., Mech., U.S. Engr. Dept., N.Y. Dist., 17 Battery Pl.; *for mail,* 2033 Valentine Ave., New York, N.Y.

Klamka, Stanley G. (J'41) (BCM), Tool & Die Engr., Carboloy Co., Inc., 844 S. Canal St.; *for mail,* 2201 N. Long Ave., Chicago, Ill.

Klauber, Laurence M. ('19) (CFS), V.P., Gen. Mgr., San Diego Gas & Elec. Co., San Diego, Calif.

Klauder, Louis T. ('16) (FKS), Prin., Louis T. Klauder & Associates, 1632 Lincoln-Liberty Bldg., Philadelphia, Pa.

Klausner, Robert J. (J'40) (ACM), 3501 Hudson Blvd., Union City, N.J.

Klees, Albert L. ('29), Fed. Light & Traction Co., 70 Pine St., New York, N.Y.

Kleffel, H. E. ('23; '35) (EFS), Exec., Power Plant Constr., Union Elec. Co., 303 N. 12th Blvd., St. Louis, Mo.

Klein, Arthur W. ('03; '11) (EKS), Prof. Mech. Engrg., Lehigh Univ.; *for mail,* 43 Wall St., Bethlehem, Pa.

Klein, August C. ('28) (EFS), Ch. Mech. Engr., Stone & Webster Engrg. Corp., 49 Federal St., Boston, Mass.

Klein, Bernard A. ('24; '35), Marlboro Inn, Montclair, N.J.

Klein, Bernard D. ('23), Pres., Gas Purifying Matls. Co., Inc., Foot of Halsey St.; *for mail,* 30-34—36th St., Long Island City, N.Y.

Klein, Edw. W. ('18; '24) (KS), Dist. Rep., Warren Webster & Co., 152 Nassau St., N.W., Atlanta, Ga.

Klein, Henry G. ('39) (FKS), Dist. Serv. Engr., Babcock & Wilcox Co., 2730 Koppers Bldg., Pittsburgh, Pa.

Klein, Joseph A. (J'36), Draftsman, Lebanon Plant, Bethlehem Steel Co.; *for mail;* 537 Lehman St., Lebanon, Pa.

Klein, Julian J. (J'33) (MRS), Prod. Supvr., Readville Shops, N.Y., New Haven & Hartford R.R., Readville; *for mail,* 141 Englewood Ave., Brookline, Mass.

Klein, Leonard M. (J'38) (DJM), Jr. Mech. Engr., U.S. Dept. of Agric., Agric. Engrg. Bldg.; *for mail,* 201 N. 29th St., Corvallis, Ore.

Klein, Otto Karl ('27), Gen. Mgr., Schaeffer & Budenberg, Magdeburg, Germany.

Klein, Rulof ('23), 35 Parkway, Montclair, N.J.

Kleinman, Harold A. ('28) (EFS), Engr., Moline-Rock Island Mfg. Co., 14th St. & 5th Ave., Moline, Ill.

Kleinschmidt, Robt. V. (21; '29), 20 East St., Stoneham, Mass.

Klemin, Alex. ('19; '31) (ABE), Chmn. of Dept., Daniel Guggenheim Sch. of Aeronautics, New York Univ., University Heights, New York, N.Y.

Klep, Martin C. ('30; '35) (AGD), Engr. Asst., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York, N.Y.; *residence,* 47 S. Mill St., Nyack, N.Y.

Klinck, J. H. ('04) (ALR), Retired; 3512 Morningside Ave., Tampa, Fla.

Kline, Clement L. ('39) (CFS), Ch. Power Engr., Chrysler Corp., 18th St. & I Ave.; *for mail,* 2410 Broad St., New Castle, Ind.

Kline, G. M. ('41) (L), Ch., Organic Plastic Sec., Natl. Bur. of Stands., Washington, D.C.; *for mail,* 109 Battery Lane, Bethesda, Md.

Kline, Lee A. ('26; '41) (EFS), Asst. Ch. Power & Fuel Engr., Carnegie-Ill. Steel Corp., 912 Salt Springs Rd., Youngstown; *for mail,* R.F.D. 1, Niles, Ohio.

Kline, Mason E. ('31) (AKW), Gen. Sales Mgr., Union Lumber Co., 1010 Crocker Bldg., San Francisco, Calif.

Kline, Paul A. (J'34) (DJM), Designer, Tramrail Div., Cleveland Crane & Engrg. Co., Wickliffe; *for mail,* 1139—12th St., N.W., Canton, Ohio.

Klinedinst, L. M. ('29), Gen. Mgr., Indus. Div., Timken Roller Bearing Co., Canton, Ohio.

Kling, Fred E. ('29), Asst. Ch. Engr., Carnegie-Ill. Steel Corp., 1318 Carnegie Bldg., Pittsburgh, Pa.; *for mail,* 2240 Selma Ave., Youngstown, Ohio.

Klintman, P. C. ('29; '35) (EFH), 52 W. Pomfret St., Carlisle, Pa.

Klock, Ernest L. ('17), Gen. Mgr., Cent. Romana, Inc., La Romana, Dominican Republic, West Indies.

Klopsch, Otto Z. ('38) (ACJ), V.P., Gen. Mgr., Wolverine Tube Co., 1411 Central Ave., Detroit, Mich.

Klosson, M. M. ('28) (BHP), Ch. Engr., Buffalo Pumps, Inc., North Tonawanda; *for mail,* 1066 Colvin Blvd., Kenmore, N.Y.

Klotz, Harry J. ('13; '20; '35) (EFS), Ch. Power Engr., Stone & Webster Engrg. Corp., 49 Federal St., Boston, Mass.

Klotz, Walter (J'40) (BJS), Asst. Mar. Engr., Supvr. of Shipbldg., U.S.N., 11 Broadway, New York, N.Y.; *for mail,* 1 Fuller Pl., Arlington, N.J.

Kluckhuhn, Fred'k Henry (J'38) (EFK), Mech. Engr., Design & Cost Analysis, Eberly & Brand, Inc., 6105 Blair Rd., Washington, D.C.

Kluesener, Hugo H. ('34; '35), Mch. Design, Am. Can Co.; *for mail,* 206 Leslie St., Newark, N.J.

Klumpp, John B. ('09), Cons. Engr., 123 S. Broad St., Philadelphia, Pa.

Klutey, Fred'k E. (J'25) (BCL), Engr., E. I. du Pont de Nemours & Co.; *for mail,* 3203 Swarthmore Rd., Wilmington, Del.

Knabe, Carl F. (J'41) (ABK), 1007 Union St., Schenectady, N.Y.

Knabe, Fred Smith (J'35) (EMR), Diesel Maintainer, Bethlehem Steel Co., Sparrows Point; *for mail,* Apt. C, 7016 Mornington Rd., Dundalk, Md.

Knapp, Edwin C. ('93; '32) (JKM), Professional Engr., 1124 Parkwood Blvd., Schenectady, N.Y.

Knapp, Robt. T. (J'21), Assoc. Prof. Hyd. Engrg., Calif. Inst. of Tech., 1201 E. California St., Pasadena, Calif.

Knapp, S. Arthur, Jr. (J'37), (EJP), Lt., U.S.A., Co. A, 15th Engrs., Ft. Bragg, N.C.; *residence,* 815—6th St., Lake Charles, La.

Knapp, Vernon W. ('33), Supt. Safety & Engrg. Dept., London Guarantee & Accident Co., Ltd., 55—5th Ave., New York, N.Y.

Knapp, Walter ('15; '23) (ACM), Dir., Methods & Rate Setting, S. Morgan Smith Co., Lincoln & Hartley Sts., York; *for mail,* Eden West, R.5, Lancaster, Pa.

Knauer, Eber ('19) (CDM), Research Engr., Burroughs Adding Machine Co.; *for mail,* 4269 Fullerton Ave., Detroit, Mich.

Knaus, Wm. L. ('39; '41) (BJK), Supervisory Engr., Power Drive Dept., Gen. Elec. Co., 1605 Winter St.; *for mail,* 3355 Garland Ave., Ft. Wayne, Ind.

Knauss, G. Edwin (J'41), J. E. Rhoads & Sons, 11th & Bancroft Pkwy., Wilmington; *for mail,* 90 Cleveland Ave., Newark, Del.

Knebel, Harvey (J'41) (ABJ), Apprentice Engr., Pan-Am. Airways, Treasure Island, San Francisco; *for mail,* 2916 Russell St., Berkeley, Calif.

Knecht, Harry ('38) (S), Div. Engr., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York, N.Y.; *for mail,* 307 Goldsmith Ave., Newark, N.J.

Knezo, John, Jr. (J'35) Jr. Engr., Breeze Corporations, Inc., 41 S. 6th St., Newark; *for mail,* 445—3rd Ave., Garwood, N.J.

Knickerbacker, John ('91), Pres., Eddy Valve Co., Waterford; *for mail,* 86—1st St., Troy, N.Y.

Kniese, Harold G. ('17; '21; '30) (CGS), Engr., Cent. Ill. Light Co., 316 S. Jefferson Ave., Peoria, Ill.

Kniffen, Allen T. (J'36) (EKS), Instr. Mech. Engrg., Poly. Inst. of Brooklyn, 85 Livingston St., Brooklyn, N.Y.

Knight, Albion W. ('21; '35) (BKS), Professional Engr., Green Fuel Economizer Co., Inc., 627 Main St.; *for mail,* 1 Wodell St., Beacon, N.Y.

Knight, Earl R. ('17; '26; '35) (BKS), Sales Engr., Manchester & Hudson Co., 573 Eddy St., Providence; *for mail,* Cor. Smith Ave. & Orchard Ave., Greenville, R.I.

Knight, Geo. L. ('05; '08; F'38), Engr. of Constr., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York, N.Y.

Knight, Seymour H. ('19) (DLS), Supvg. Engr., Strawbridge & Clothier, 8th & Market Sts., Philadelphia; *for mail,* 615 Manoa Rd., Penfield, Upper Darby P.O., Pa.

Knight, Sidney ('41) (ACL), Staff Mem., McKinsey & Co., Lincoln Bldg., New York, N.Y.; *for mail,* 12 Sunset Ave., Montclair, N.J.

Knipe, Robert K. (J'33) (ABE), Engr., E. G. Budd Mfg. Co., 25th & Hunting Park; *for mail,* 6629 N. 8th St., Philadelphia, Pa.

Knipping, R. H. ('19; '26) (EFS), Engr., Sales Dept., A. M. Lockett & Co., Ltd., 308 Whitney Bldg., New Orleans, La.

Kniskern, Walter H. ('05; '12) (BKS), Consultant, Nitrogen Div., Solvay Process Co., Hopewell, Va.

Morgan, Paul B. ('91; '00) (CJM), Chmn., Bd. of Dirs., Morgan Constr. Co., 15 Belmont St., Worcester, Mass.
Morgan, Thos. A. ('29), Pres., Sperry Corp., 30 Rockefeller Plaza, New York, N.Y.
Morgenroth, Robert J. ('25; '34) (BCM), Prod. Engr., Christiana Mch. Co.; *for mail,* 414 Bridge St., Christiana, Pa.
Morhard, William (J'41) (DMS), Apprentice Research Engr., Detroit Edison Co., 2000—2nd Ave.; *for mail,* 16904 Wildemere, Detroit, Mich.
Morhardt, Frank W. ('18) (BLM), Mech. Supt., Royal Typewriter Co., Inc., 150 New Park Ave., Hartford, Conn.
Morikawa, Geo. K. (J'39) (ABH), Graduate Asst., Calif. Inst. of Tech., 1201 E. Calif. St., Pasadena, Calif.
Morin, Louis H. ('30), Engr. Consultant, Gries Reproducer Corp., 463 E. 133rd St.; *for mail,* 888 Grand Concourse, New York, N.Y.
Moritz, Adrianus J. L. ('30), Tech. V.P., Am. Enka Corp., Enka, N.C.
Moritz, Harold K. (J'21), Instr., Dept. of Gen. Engrg., Univ. of Wash., Seattle, Wash.
Morken, Carl H. ('37) (CJL), Gen. Supt., Carondelet Fdy. Co., 2101 S. Kingshighway, St. Louis, Mo.
Morley, Marcus D. ('17; '23), Mgr., Serv. & Erection Depts., Combustion Engrg. Co., Inc., 200 Madison Ave., New York, N.Y.
Moroz, Peter Joseph (J'40) (CLS), Draftsman, E. I. du Pont de Nemours & Co., Parlin; *for mail,* 48 Augusta St., South River, N.J.
Morrell, Herbert (J'41), Student in Training, Remington Arms Co., Barnum Ave.; *for mail,* 580 Beechwood Ave., Bridgeport, Conn.
Morris, Benj. F. ('30; '35) (CDL), V.P., Div. Mgr., Thomas A. Edison, Inc., Bellville Pike, Kearny, N.J.
Morris, Francis C. (J'40), Exper. Eng. Tester, Wright Aero. Corp., Paterson; *for mail,* 8 James St., Montclair, N.J.
Morris, Glenn L. (J'37) (AFS), Estimator, Combustion Engrg. Co., Inc., 200 Madison Ave., New York; *residence,* 37-06—89th St., Jackson Heights, L.I., N.Y.
Morris, J. P. ('40), Gen. Mech. Asst., Atchison, Topeka & Santa Fe Ry., 80 E. Jackson Blvd., Chicago; *for mail,* 205 North Spring Ave., La Grange, Ill.
Morris, John K. (J'35) (ABP), Ch. Engr., Pac. Gear Works, 2053 E. 38th St., Los Angeles, Calif.
Morris, Matthew K. (J'40) (CFK), Jr. Exper. Engr., Bethlehem Steel Co., 3rd St.; *for mail,* 65 W. Market St., Bethlehem, Pa.
Morris, Richard H. ('36) (FHK), *Student Award,* '21; Engrg. Editor, *Power Plant Engineering,* 53 W. Jackson Blvd., Chicago, Ill.
Morris, Russell T. (J'41), 82 Bullman St., Phillipsburg, N.J.
Morris, Thos. B. ('10; '26) (CFM), Secy., Treas., Mitchell Steel Co., Beekman St. & Fricke Rd.; *for mail,* 3047 Lischer Ave., Cincinnati, Ohio.
Morris, Thos. C. ('18) (BHL), Mgr. of Engrg., Nitrogen Div., Solvay Process Co., Hopewell, Va.
Morris, W. Stanley ('24; '32; '35) (BJS), Designer, Lunkenheimer Co., Beekman & Waverly Sts.; *for mail,* 1742 Portman Ave., Bond Hill Cincinnati, Ohio.
Morris, Wm. C. (J'39) (ERS), Asst. Engr., Rural Electrification Admin; *for mail,* 3148 Wisconsin Ave., N.W., Washington, D.C.
Morris, William C. ('41), Main & Sheridan Dr., Clarence, N.Y.
Morris, Wm. Cullen ('14), V.P., Gas Engrg., Consltd. Edison Co. of N.Y., Inc., 4 Irving Pl., New York, N.Y.
Morrish, Murray (J'34) (BKS), Draftsman, Lever Bros., Ltd., 299 Eastern Ave., Toronto; *for mail,* Highland Creek P.O., Ont., Can.
Morrison, J. P. ('16) (FMS), Asst. Ch. Engr., Hartford Steam Boiler Inspc. & Ins. Co., 56 Prospect St., Hartford, Conn.
Morrison, Joe W. (J'39) (AJM), Ch. Engr., Brass Specialties Div., West. Cartridge Co., East Alton; *for mail,* 906-A E. 7th St., Alton, Ill.
Morrison, Kenneth L. (J'38) (ELP), Petroleum Engr., Devel. Dept., Sinclair Refining Co., 3500 Indianapolis Blvd., East Chicago, Ind.; *for mail,* 10348 Eberhart Ave., Chicago, Ill.
Morrison, Thomas (J'37) (CLS), Plant Engr., Research Enterprises Ltd., Leaside; *for mail,* 21 Cranbrooke Ave., Toronto, Ont., Can.
Morriss, Arthur D. ('19; '35), Box 251, Washingtonville, N.Y.
Morrissey, John P. ('24), Pres., John P. Morrissey Elec. Co., Inc., 405 Lexington Ave., New York, N.Y.
Morrissey, Peter J. ('13), 19 Holly Dr., New Rochelle, N.Y.
Morrow, Cole H. (J'40) (CFS), Engr., J. I. Case Co., 700 State St.; *for mail,* 500 Augusta St., Racine, Wis.
Morrow, John G. (J'38), Jacob Ruppert Brewery, 1639—3rd Ave., New York; *for mail,* 51-25—63rd St., Woodside, L.I., N.Y.
Morrow, Jos. H. ('26; '30), Ch. Engr., Fuller Co., Fuller Bldg., Catasauqua, Pa.
Morrow, Lester C. ('16; '24) (CDG), Editor, *Factory Management and Maintenance,* McGraw-Hill Publ. Co., Inc., 330 W. 42nd St., New York, N.Y.
Morrow, Lester Wm. Wallace ('23), R.F.D. 4, New Brunswick, N.J.
Morrow, Robert Lee ('22; '29) (C), 114 W. 183rd St., New York, N.Y.
Morrow, William J. (J'41) (ABH), Test Engr., Hamilton Stand. Propellers, East Hartford; *for mail,* 303, 19 Frederick St., Hartford, Conn.
Morse, Arley E. (J'34), Engr., Charge Design, Huron Indus. Co., Alpena; *for mail,* 612 N. Trumbull St., Bay City, Mich.
Morse, Chas. H. ('97; '04), Retired; 600 S. Michigan Ave., Chicago, Ill.
Morse, Daniel P. (J'39) (ACM), Assembly Engr., Allison Div., Gen. Motors Corp., Speedway City; *for mail,* 4440 Marcy Lane, Indianapolis, Ind.
Morse, Edw. P., Jr. ('18), 630 Victory Blvd., Staten Island, N.Y.
Morse, Francis (J'39), 7840 Torreyson Dr., Hollywood, Calif.
Morse, Henry S. ('18) (BKL), Planning Engr., Charge Design, Monsanto Chem. Co., Monsanto, Ill.; *for mail,* 4166 Lindell Blvd., St. Louis, Mo.
Morse, Jas. W. ('30; '35) (CH), Ch. Engr., Lansing Div., John Bean Mfg. Co., Hazel St., Lansing; *for mail,* 1015 Short St., East Lansing, Mich.
Morse, Louis S. ('32) (CJL), Exec. Engr., York Ice Mchy. Corp., York, Pa.
Morse, Louis S., Jr. (J'33) (CGK), Mgr., Spee-D Chem. Serv., 415 Brainard St., Detroit, Mich.
Morse, Robt. V. ('22) (AE), Professional Engr., Pat. Atty., 521 Wyckoff Rd., Ithaca, N.Y.
Morse, William H. (J'41) (ABH), 1338 Sheridan Ave., Pittsburgh, Pa.
Morss, Chas. A. ('26; '35) (AE), Designer, Pratt & Whitney Aircraft, Main St., East Hartford; *for mail,* 91 Ledyard Rd., West Hartford, Conn.
Mortimer, Jas. D. ('20) (BES), R.D. 4, Belfast, Me.
Morton, Allen W. ('28) (AER), V.P., Gen. Mgr., Am. Hammered Piston Ring Div., Koppers Co., Bush & Hamburg Sts., Baltimore, Md.
Morton, Arthur B. ('17), Thompsons Engrg. & Pipe Co., Ltd., Castlemaine, Victoria, Australia.
Morton, Byron B. (M'36), Res. Engr., Internatl. Nickel Co., 67 Wall St., New York, N.Y.
Morton, Harry E. ('41) (CFS), Sales Engr., Hagan Corp., 300 Ross St., Pittsburgh, Pa.; *for mail,* 10827 Normal Ave., Chicago, Ill.
Morton, Henry S. (J'40) (BCH), Exper. Engr., Am.-La France-Foamite Corp., Elmira, N.Y.
Morton, Richard G. (J'41) (CKS), Test Man, Gen. Elec. Co., Schenectady, N.Y.; *for mail,* The Breakers, 285 Lynn Shore Dr., Lynn, Mass.
Morton, Roscoe W. ('24; '30; '32) (FKS), Prof. Mech. Engrg., Head of Dept., Univ. of Tenn., 100 Estabrook Hall, Knoxville, Tenn.
Mosbacher, Karl J., Jr. (J'41) (AES), Student Engr., Erie Works, Gen. Elec. Co.; *for mail,* 1029 Rumsey, Erie, Pa.
Moseley, Alex W. ('00), 1705 Ridge Ave., Evanston, Ill.
Moser, Kenneth J. (J'37) (BES), Asst. Prof. Mech. Engrg., Sch. of Engrg., Villanova College, Villanova; *for mail,* 17 S. Roberts Rd., Bryn Mawr, Pa.
Moser, Norman W. (J'37) (S), Watch Engr., Tri-State Power Cooperative, Genoa, Wis.
Moses, Eliot B. ('23; '30) (AHR), Engr., Hyd. Design, U.S. Bur. of Reclamation, Custom House, Denver, Colo.
Moses, Fred C. ('18; '26), Mech. Engr., West. Elec. Co., Inc., 80 John St., New York, N.Y.; *for mail,* 130 Stelle Ave., Plainfield, N.J.
Moses, Fred'k T. ('16; '23), V.P., Engr., Firemans Mutual Ins. Co., 10 Weybossett St. & 560 Lloyd Ave., Providence, R.I.
Moses, Richard (J'41) (BDL), Maint. Electrician, E. I. du Pont de Nemours & Co., Belle; *for mail,* 219½ Truslow St., Charleston, W.Va.
Moses, Warren G. (J'41) (ACK), Mech. Engr., Equitable Equip. Co., 410 Camp St., New Orleans, La.
Mosher, Fred D. (J'36) (CRS), Engr., Babcock, & Wilcox Co., 85 Liberty St., New York, N.Y.; *for mail,* 710 Liberty St., Erie, Pa.
Moshkoff, S. V. ('28) (DHS), Supt. of Properties, Furman Shoals Devel., Ga. Power Co., Atlanta; *for mail,* Furman Shoals, Milledgeville, Ga.
Moslander, Kenneth D. (J'40) (BCG), Assoc. Editor, *Machine Design,* Penton Publ. Co., W. 3rd St., Cleveland; *for mail,* 2996 Somerton Rr., Cleveland Heights, Ohio.
Moss, Edw. H., Jr., (J'37) (BHK), Engr., Engrs. & Fabricators, Inc., P.O. Box 7395, Houston, Tex.
Moss, Herbert H. ('17; '35) (BJM), Devel. Engr., Linde Air Products Co., 686 Frelinghuysen Ave., Newark, N.J.
Moss, Sanford A. ('03; F'40) (ABH), Cons. Engr., Gen. Elec. Co., 920 Western Ave., West Lynn, Mass.
Moss, W. W., Jr. ('40), 3904 Bateman Ave., Baltimore, Md.
Mossberg, Frank ('95), Pres., Mossberg Pressed Steel Corp.; *for mail,* 141 Pleasant St., Attleboro, Mass.
Motheral, Harry Haviland ('25; '35) (HK), Asst. Hull Supt, U.S.N., Navy Yard, New York, N.Y.
Mott, Chas. S. ('98; '09), Dir., Gen. Motors Corp., Detroit, Mich.
Mott, Gilbert Culver (J'37) (BCJ), Bridgeport Brass Co.; *for mail,* 181 Whitney Ave., Bridgeport, Conn.
Mouat, Harry G. ('23; '35), So. Mgr., Whiting Corp., 830 Martin Bldg., Birmingham, Ala.
Mould, Arthur E. (A'21) (EMP), Sales Engr., Tide Water Associated Oil Co., 17 Battery Pl., New York; *for mail,* 66 Pfohl Pl., Williamsville, N.Y.
Moulton, Clarence F. ('26; '33; '35) (CFS), Test Engr., Neb. Power Co., 4th & Jones Sts.; *for mail,* 2316 Fontenelle, Blvd., Omaha, Neb.
Moulton, Kenneth C. (J'41) (BCS), Test Man, Gen. Elec. Co., 1 River Rd.; *for mail,* 2141 Campbell Ave., Schenectady, N.Y.
Moultrop, Irving E. ('02; F'36) (EFS), *Manager,* '08-'11; *Vice-President,* '12-'14; Cons. Engr., 28 Adams St., Belmont, Mass.
Mount, Ralph H. ('17) (C), Asst. to Pres., Essex Wire Corp., 14310 Woodward Ave., Detroit; *for mail,* 26034 Dundee Rd., Huntington Woods, Mich.
Mousson, J. M., 2nd ('37) (CHS), Hyd. Engr., Safe Harbor Water Power Corp., 1611 Lexington Bldg., Baltimore, Md.
Mowat, J. Fred ('16) (FJS), Engr., Carnegie-Ill. Steel Corp., 208 S. LaSalle St., Chicago; *for mail,* 538 S. Park Rd., La Grange, Ill.
Mowat, Brig. Gen. Magnus ('38; F'38), Secy., The Institution of Mechanical Engineers, Storey's Gate, St. James Park, London, S.W. 1, England.
Mowatt, Wm. T. ('28), Supt., Steam & Elec. Generation of San Francisco, 220 Golden Gate Ave., San Francisco, Calif.
Moxham, Egbert ('06; '12), c/o Brunswick Mar. Constr. Corp, Brunswick, Ga.

Moxley, Stephen D. ('24; '26; '30) (BCD), Asst. to V.P., Am. Cast Iron Pipe Co., Birmingham, Ala.
Moxon, Alfred W. (J'39) (BCM), Engr., Div. Supvr., Eastman Kodak Co., Kodak Park, Rochester; *for mail,* 211 Park Rd., Point Pleasant, N.Y.
Moyer, Jas. A. ('07) (EJS), State Dir. of Univ. Ext., Commonwealth of Mass., State House, Boston, Mass.
Moyer, Malcolm B. ('28), Cons. Engr., 214 Ruhamah Ave., Syracuse, N.Y.
Moyer, Robt E., Jr. ('29; '38) (DLS), V.P., Charge Engrg. Sales, Heilman Boiler Works. Inc., Front & Linden Sts., Allentown, Pa.
Moyer, Robert George (J'40) (JMP), Research Engr., Pure Oil Co., Box 266, Winnetka; *for mail,* 2237 Foster Ave., Chicago, Ill.
Moyer, Stanley ('41) (BHS), Engr., Philadelphia Elec. Co., 900 Sansom St., Philadelphia; *for mail,* Burnside Ave., Norristown R.D. 2, Norristown, Pa.
Mrvosh, John (J'37), Observer, Carnegie-Ill. Steel Corp.; *for mail,* 549 Halcomb Ave., Clairton, Pa.

Muchnic, Chas. M. ('27), Suite 2048, 420 Lexington Ave., New York, N.Y.
Mudd, John P. ('10; '15; '35) (CJM), Personnel Supvr., Midvale Co., 173 Manheim St., Philadelphia, Pa.
Mudge, Robt. S. (J'35) (BMS), Pres., Palo-Myers, Inc., 81 Reade St., New York; *for mail,* 856 Park Pl., Brooklyn, N.Y.
Mudge, Sterling W. ('14; '20; '24) (CP), Education & Training, Socony-Vacuum Oil Co., Inc., 26 Broadway, New York, N.Y.
Muehlman, R. L. (J'40) (KLS), Mech. Engr., Carbide & Carbon Chems. Corp., South Charleston; *for mail,* 1212 Kanawha St., Charleston, W.Va.
Mueller, A. A. (J'40), 184—6th St., Barberton, Ohio.
Mueller, Felix J. ('24), Ch. Draftsman, Steam Turbine Dept., Allis-Chalmers Mfg. Co.; *for mail,* 1558 S. 58th St., West Allis, Wis.
Mueller, Frank H. ('39) (BCM), Dir., Research & Devel., Mueller & Co., 512 W. Cerro Gordo St., Decatur, Ill.
Mueller, Herman G. ('24), Secy., Treas., Ajax Iron Works, Corry; *for mail,* 649 Hilltop Rd., Erie, Pa.
Mueller, Lester (J'38) (BEF), Asst. Engr., Mech., U.S. Engr. Dept., 415 P.O. Bldg.; *for mail,* Box 671, Norfolk, Va.
Mueller, Paul M. ('23; '24; '35), Rome Div., Revere Copper & Brass Inc.; *for mail,* 800 N. George St., Rome, N.Y.
Mueller, Raymond A. (J'40) (HJ), Testing Engr., Research Labs. (Welding), Crane Co., 4100 S. Kedzie Ave.; *for mail,* 6110 S. Tallman Ave., Chicago, Ill.
Mueller, Victor H. ('07; '21), Pub. Serv. Elec. & Gas Co., Newark; *for mail,* 25 Maple Terrace, East Orange, N.J.
Mueller, William C. ('28) (BCM), Mfg. Engr., Hawthorne Plant, West. Elec. Co.; *for mail,* 2225 Giddings St., Chicago, Ill.
Muench, Frank J., Jr. (J'40) (CLM), Mech. Engr., Gen. Mch. Co., 398 Market St.; *for mail,* 58 Monticello Ave., Newark, N.J.
Muenchinger, Herman G. (J'38) (JLM), Mech. Engr., Am. Screw Co., 21 Stevens St., Providence; *residence,* 68 Kay St., Newport, R.I.
Muerle, Richard W. ('35) (BHM), Ch. Product Engr., Hummer Mfg. Co., 1400 S. 9th St.; *for mail,* 1829 Outer Park Dr., Springfield, Ill.
Muessel, Chas. A. (J'36) (CHS), Sales Engr., Westinghouse Elec. Internatl. Co., 40 Wall St., New York; *for mail,* 1207 California Rd., Tuckahoe, N.Y.
Mugfor, R. J. ('37) (BPS), Mech. Engr., Shaw-Kendall Engrg. Co., 120 S. Superior St., Toledo, Ohio.
Muhlig, J. R. ('29; '35; '35) (CLT), Project Engr., E. I. du Pont de Nemours & Co.; *for mail,* 1210 Overton St., Old Hickory, Tenn.
Muir, Jas. F. ('20) (EFS), Power Engr., Am. Water Works & Elec. Co., 50 Broad St., New York, N.Y.
Muir, Roy Cummings ('17) (CES), V.P., Charge Engrg., Gen. Elec. Co., 1 River Rd., Schenectady, N.Y.
Muir, Wm. P. ('39) (BJM), Ch. Engr., Dominion Engrg. Works, Ltd., P.O. Box 220, Montreal, Que., Can.
Mulford, Stewart F. (J'40) (BKS), Test Engr., Besler Systems, 4053 Harlan Ave., Emeryville; *for mail,* 1637 Spruce St., Berkeley, Calif.
Mullaly, Arthur B. (J'38), Sales Engr., Advance Solvents & Chem. Co., New York, N.Y.; *for mail,* 70 Monmouth Dr. Deal, N.J.
Mullen, Bernard J. ('36), Ch. Plant Engr., Dept. of Water Supply, City of Detroit, 8300 W. Warren Ave., Dearborn; *for mail,* 17534 Birchcrest Dr., Detroit, Mich.
Mullen, Chas. A. ('27; '35), Mech Engr., Brooklyn Edison Co., 380 Pearl St., Brooklyn; *for mail,* 9509—117th St., Richmond Hill, L.I., N.Y.
Mullen, John O. (J'40), Univ. of Tampa, Tampa, Fla.
Mullen, Lester H. (J'37) (EKP), Engr., Stand. Oil Co. of Calif., 255 Bush St., San Francisco; *for mail,* 1606 Stannage Ave., Berkeley, Calif.
Mullen, Thos. Y. (J'37) (CDM), Prod. Engrg., Westinghouse Elec. & Mfg. Co., 306—4th Ave., Pittsburgh; *for mail,* 1317 Good St., Reading, Pa.
Muller, Daniel L. ('34; '34; '35) (ELS), Boiler & Mchy. Dept., Marsh & McLennan, Inc., 70 Pine St., New York, N.Y.
Muller, Edw. A. ('90; F'36) (BCM), *Manager,* '24-'27; *Vice-President,* '27-'29; Pres., Treas., Gen. Mgr., King Mch. Tool Co., Winton Pl., Cincinnati, Ohio.
Muller, Ellsworth A. (J'41) (BKS), Prod. Engrg., Tite Flex Metal Hose Co., 500 Frelinghuysen Ave., Newark, N.J.; *for mail,* 1991 Cruger Ave., New York, N.Y.
Muller, F. G. D. ('30) (CMP), V.P., Charge Design, Staytite Co., 3608 Polk Ave., Houston, Tex.
Muller, Herman E. (J'39) (BJS), Jr. Mech. Engr., Navy Yard; *for mail,* 929 Clinton St., Philadelphia, Pa.
Muller, Julius ('27; '28; '35) (BJR), Welding Engr., O. C. Duryea Corp., 30 E. 42nd St., New York, N.Y.; *for mail,* 10743 S. Wood St., Chicago, Ill.
Muller, Otto ('33) (CJM), Div. Supt., Am. Optical Co., Mechanic St.; *for mail,* 44 Newell Ave., Southbridge, Mass.
Muller, Raymond W. ('16; '19; '35), Works Engr., Vulcan Detinning Co., Sewaren, N.J.
Muller, Richard F. ('21; '29; '35) (HS), Sales Engr., Allis-Chalmers Mfg. Co., 1124 Canal Bank Bldg., New Orleans, La.
Muller, Richard J. (J'40) (GHJ), 4711 Davenport St., N.W., Washington, D.C.
Muller, Richard O. ('13) (BJM), Ch. Engr., Terry Steam Turbine Co., Terry Sq., Hartford, Conn.
Muller, Robt. A. ('24; '37), Gen. Prod. Mgr., Atlas Plywood Corp., 934 Park Sq. Bldg., Boston; *for mail,* 29 Albion Rd., Wellesley Hills, Mass.
Mullergren, Arthur L. ('18; '28) (CES), Cons. Engr., 204 Fairfax Bldg., Kansas City, Mo.
Mullhaupt, Alfred, Jr. (J'11), Engr., Bradford Oil Refining Co.; *for mail,* 25 School St., Bradford, Pa.
Mulligan Paul B. (J'35) (ACD), Prin. Indus. Engr., Montgomery Ward Co., 619 W. Chicago Ave., Chicago; *for mail,* 657 Forest Ave., Glen Ellyn, Ill.
Mullikin, H. F. ('30; '41) (FKS), *Junior Award,* '36; Analytical Engr., Babcock & Wilcox Co., 85 Liberty St., New York; *for mail,* 141-48—78th Ave., Flushing, L.I., N.Y.
Mullins, Edw. E. ('19) (FPS), Ch. Engr., Sinclair Cuba Oil Co., S.A., P.O. Box 2569, Havana, Cuba.
Mullins, Euthan V. (J'41) (CDS), 1968 Jasmine St., Denver, Colo.
Mulveny, Frank, Jr. (J'37) (CFS), Mech. Engr., Edge Moor Iron Works Co., Edge Moor; *for mail,* 203 Lighthouse Rd., Gordon Heights, Del.
Mumford, Albert R. ('19; '24; '27) (FKS), Sr. Research Assoc., Consltd. Edison Co. of N.Y. Inc., 4 Irving Pl., New York, N.Y.
Mumford, Stephen F. (J'40) (FKS), Mar. Dept., Combustion Engrg. Co., Inc., 200 Madison Ave., New York, N.Y.; *for mail,* Maple Ave., Mountain View, N.J.
Mummery, C. R. ('30; '35) (CJM), Sec. Head, Research Engr., Statistician, Hoover Co.; *for mail,* 606 E. Maple St., North Canton, Ohio.
Munck, Ludwig R. ('38), Sales Engr., Foster Wheeler Corp., 634 Michigan Bldg.; *for mail,* 18651 Cherrylawn Ave., Detroit, Mich.
Mundy, Jas. T. (J'39) (BL), Post Ord. Office, Fort Jackson, S.C.
Munger, Milton P., Jr. (J'37), Serv. Man., Scott Co., 243 Minna St., San Francisco; *for mail,* 2829 Regent St., Berkeley, Calif.
Munier, Leon L. ('21; '26) (S), Pres., Wolff & Munier Inc., 222 E. 41st St., New York, N.Y.
Munro, Robt. W. (J'24) (EKS), Sales Engr., Griscom-Russell Co., 1317 Land Title Bldg., Philadelphia, Pa.
Munson, Horace D. ('40) (CDL), Engr., Niagara Operas., Mathieson Alkali Works, Inc.; *for mail,* 134—57th St., Niagara Falls, N.Y.
Munson, John G. ('17) (J), V.P., Charge Raw Matls., U.S. Steel Corp. of Del., 436—7th Ave., Pittsburgh, Pa.
Munson, Lloyd E. (J'41) (ABH), Jr. Stress Analyst, Glenn L. Martin Co., 828 Park Ave., Baltimore, Md.
Munson, Stanley ('11; '25) (DKL), Plant Engr., Kirkman & Son, Div. of Colgate-Palmolive-Peet Co., 215 Water St., Brooklyn; *for mail,* 89-11—198th St., Hollis, L.I., N.Y.
Murphy, Benj. S. ('05; '16) (FKS), Ch. Engr., Hudson Ave. Sta., Brooklyn Edison Co., 1 Hudson Ave., Brooklyn, N.Y.; *for mail,* 2600 Boulevard, Jersey City, N.J.
Murphy, Bernard R. (J'41) (CJM), 36 Cheltenham Ave., Toronto, Ont., Can.
Murphy, E. Landry (J'40) (ABC), Civilian Instr., Air Corps Tech. Sch., Keesler Field, Biloxi; *for mail,* Box 88, Route 1, Gulfport, Miss.
Murphy, Edw. T. ('05; '17) (KLT), V.P., Carrier Corp., 310 S. Geddes St., Syracuse, N.Y.
Murphy, Eugene F. (J'35) (BES), Instr., Mech. Engrg. Dept., Univ. of Calif., Berkeley, Calif.
Murphy, Francis Blake (J'40) (AC), Test Engr., Hamilton Stand. Propellers, East Hartford; *for mail,* 60 Tryon St., South Glastonbury, Conn.
Murphy, Francis G. (J'40), (ACS), Engr., Bailey Meter Co., Ltd., Montreal, Que.; *for mail,* 36 Cheltenham Ave., Lawrence Park, Toronto, Ont., Can.
Murphy, Geo. A., Jr. (J'41) (CK), Draftsman, Designer, Babcock & Wilcox Co.; *for mail,* 600 Park Ave., Barberton, Ohio.
Murphy, George F. ('26; '35) (BKM), Design Engr., Linde Air Products Co., 646 Frelinghuysen Ave., Newark; *residence,* 647 Elm St., Westfield, N.J.
Murphy, George W. (J'41), Serv. Engr., Westinghouse Elec. & Mfg. Co., Box 1017, Pittsburgh, Pa.
Murphy, Howard C. ('32) (EFK), V.P., Am. Air Filter Co., Inc., 215 Central Ave., Louisville, Ky.
Murphy, John V. (J'40) (ABJ), Jr. Mech. Engr., Wright Field; *for mail,* 526 Richmond Ave., Dayton, Ohio.
Murphy, Paul, Jr. (J'41) (BDE), 549 Tyler, Gary, Ind.
Murphy, Richard Van Dyke (J'41), Cadet Engr., Tar & Chem. Div.; Koppers Co.; *for mail,* 645 Belgrove Dr., Kearny, N.J.
Murphy, Robt. E. ('36) (CDM), Plant Engr., Am. Chicle Co., 30-30 Thomson Ave., Long Island City; *for mail,* 17 Golf View Pk., Flushing, L.I., N.Y.

Paugh, Chas. T. ('18; '20; '25) (BCL), Ch. Engr., Peter Cailler Kohler Swiss Chocolates Co.; *for mail,* 353 Division St., Fulton, N.Y.
Paugh, G. Ruel ('23) (FKS), Sales Engr., Babcock & Wilcox Co., 85 Liberty St., New York, N.Y.; *for mail,* 325 Maolis Ave., Glen Ridge, N.J.
Paukner, Frank (J'29) (JLM), Die Designer, E. W. Bliss Co., 53rd St. & 2nd Ave., Brooklyn; *for mail,* 86-18—102nd St., Richmond Hill, L.I., N.Y.
Paul, Ellis E. ('38) (BJM), Asst. Engr., Ash-Howard-Needles & Tammen, 55 Liberty St., New York, N.Y.; *for mail,* 14 Colony Dr. W., West Orange, N.J.
Paul, R. F. ('41) (BJS), Mech. Engr., Philadelphia Elec. Co., 900 Sansom St., Philadelphia; *for mail,* 514 Berkeley Rd., Narberth, Pa.
Paul, Ralph C. ('25; '35), Asst. to Mgr., Diesel Eng. Div., Am. Loco. Co.; *for mail,* 105 Mary St., Auburn, N.Y.
Paull, W. R. ('31; '35), 356 North H St.; *for mail,* 502 Peralta Way, Fresno, Calif.
Paulsen, Alfred G. ('23) (CES), Assoc. Oper. Sponsor, Internatl. Div., Ebasco Services, Inc., 2 Rector St., New York, N.Y.
Paulsen, Henry J., Jr. (J'41), Student Engr., Cadillac Motor Car Div., Gen. Motors Corp.; *for mail,* Apt. 104, 2024 Hubbard St., Detroit, Mich.
Paulson, E. E. (J'41) (ABH), Supercharger Engr., Gen. Elec. Co., River Works; *for mail,* 203 Lewis St., Lynn, Mass.
Pausin, Hugo R. ('16; '17), Pres., Gen. Mgr., Pausin Engrg. Co., 727 Frelinghuysen Ave., Newark; *for mail,* 5 Wellesley Rd., Maplewood, N.J.
Pautler, Anthony C. (J'41) (DJL), Process Dept., Remington Arms Co., Inc., Barnum Ave.; *for mail,* 795 Colorado Ave., Bridgeport, Conn.
Pavulak, Michael (J'39), Mech. Engr., Research & Design, Smith, Drum & Co., Allegheny Ave.; *for mail,* 415 Unruh St., Philadelphia, Pa.
Paxton, Chas. H. ('24) (EFG), Assoc., Univ. of Calif., 405 Hilgard Ave.; *for mail,* 4201 Dalton Ave., Los Angeles, Calif.
Payne, Don I. (J'38) (CDM), Prod. Engr., Teletype Corp., 1400 Wrightwood Ave., Chicago, Ill.
Payne, Earl C. ('28) (FKS), Cons. Engr., Consolidation Coal Co., 30 Rockefeller Plaza, New York, N.Y.; *for mail,* 109 Fairmount Ave., Chatham, N.J.
Payne, Francis H. (A'17) (CE), Pres., Mgr., Metric Metal Works, Am. Meter Co., Inc., Box 1251 Erie, Pa.
Payne, Frank E. ('22) (BHS), Pres., Crane Packing Co., 1800 Cuyler Ave., Chicago, Ill.
Payne, John Howard (J'39) (ACM), Magnaflux Technician, Aviation Div., Studebaker Corp., South Bend, Ind.
Payne, Sheldon F. ('07), Cons. Mech. Engr., G.I.R. Glove Mfg. Co.; *for mail,* 32 Spencer St., Naugatuck, Conn.
Payne, Walter E. (J'39) (CES), Student Engr., Tex. Elec. Serv. Co., Elec. Bldg., Ft. Worth; *for mail,* 4332 Edmondson, Dallas, Tex.
Peabody, Ernest H. ('00), Pres., Peabody Engrg. Corp., 580—5th Ave., New York, N.Y.
Peace, Chas. S. ('29; '35) (EFS), Plant Betterment Engr., Ebasco Services Inc., 2 Rector St., New York, N.Y.
Peale, W. O. ('40), Salesman, C.S. Div., Westinghouse Elec. & Mfg Co., 118 E. Lombard St.; *residence,* 4203 Ridgewood Ave., Baltimore, Md.
Pearce, Bert L. (J'35) (CDM), Mech. Engr., Ewart Works, Link-Belt Co., 220 S. Belmont Ave.; *for mail,* 4820 Broadway, Indianapolis, Ind.
Pearce, C. E. ('40) (AB), Prof. & Head, Dept. of Mch. Design, Coordinator of C.P.T.P., Kan. State College, Manhattan, Kan.
Pearce, E. S. ('15; '25) (LMR), Pres., Ry. Serv. & Supply Corp., 510 S. Harding St., Indianapolis, Ind.
Pearce, G. F. (J'40) (ABM), Aero. Engr., Royal Canadian Air Force; *for mail,* 1764 Westbrook Crescent, Vancouver, B.C., Can.
Pearce, Lester F. ('21; '35) (BFS), Mech. Designer, Ebasco Services Inc., 2 Rector St., New York, N.Y.; *for mail,* 769—1st St., Westfield, N.J.
Pearce, Robt. Edw. (J'38) (BKS), Minneapolis-Honeywell Regulator Co., 2405 Maryland Ave., Milwaukee, Wis.
Pearce, Robt. T. ('13) (CD), 239 Scotch Plains Ave., Westfield, N.J.
Pearl, Wm. A. ('39) (DJ), Dir. of Devel., Whiting Corp., 157 Lathroop Ave.; *for mail,* 8508 Constance Ave., Chicago, Ill.
Pearman, Edward ('29; '31; '35) (CDL), Plant Engr., Hoffman Beverage Co., 400 Grove St., Newark; *for mail,* 161 Prospect St., East Orange, N.J.
Pearson, Charles R. (J'40) (ACG), Jr. Engr., Engrg. Dept., Charge Engrg. Library, Boeing Aircraft Co.; *for mail,* 1720—16th Ave., Seattle, Wash.
Pearson, Darwin E. (J'40) (BCD), Student Engr., Container Corp. of Am., 3 N. Sherman; *for mail,* 820 W. 7th St., Anderson, Ind.
Pearson, David Adams (J'41), Co. C, 6th Bn., Engrs. Reserve Corps, Fort Belvoir, Va.
Pearson, Harry R. ('34; '35) (EFS), Engr., Engrg. Dept., Dallas Power & Light Co., Dallas, Tex.
Pearson, Nils A. ('39) (EFS), Supvg. Engr., Ocean Accident & Guarantee Corp., 512 Transportation Bldg., Washington, D.C.
Pearson, Robert ('28) (AES), Cons. Engrg. Serv., 212 N. 3rd St., Harrisburg, Pa.
Pease, Robert M. ('21; '35) (JMP), V.P., Mgr., Axelson Mfg. Co., 3844 Walsh St., St. Louis; *for mail,* 530 Warren Ave., University City, Mo.
Peaslee, Dana N. ('31) (EKP), Mech. Engr., E. B. Badger & Sons Co., 75 Pitts St., Boston, Mass.
Peaslee, W. ('16; '23) (CHJ), Works Mgr., Cincinnati Milling Mch. Co., Cincinnati Grinders, Inc., Oakley, Cincinnati, Ohio.
Peaslee, W. D. A. ('21; '30) (ACM), Bendix Products Div., Bendix Aviation Corp.; *for mail,* 1235 E. Wayne St. S., South Bend, Ind.
Peavey, J. M. ('28; '35) (CGL), Div. Mgr., Dept. of Opers., Tenn. Valley Authority, 1035—3rd Natl. Bank Bldg., Nashville, Tenn.
Pechacek, Raymond E. (J'40), Draftsman, Wyatt Metal & Boiler Works; *for mail,* 4605 Norhill, Houston, Tex.
Peck, Charles V. ('41) (BCS), Office Engr., Green Fuel Economizer Co., Inc., 165 Broadway; *for mail,* 332 E. 71st St., New York, N.Y.
Peck, Clair B. ('14; '35) (CER), *Vice-President,* '41-'43; Managing Editor, *Railway Mechanical Engineer,* Mech. Dept. Editor, *Railway Age,* Simmons-Boardman Publ. Corp., 30 Church St., New York, N.Y.
Peck, Clarence E. ('28; '35), Engr., Charge Indus. Heating Sec., Westinghouse Elec. & Mfg. Co., East Pittsburgh; *for mail,* 2329 Greensburg Pike, Wilkinsburg, Pa.
Peck, Eugene C. ('09) (BDJ), Pres., Gen. Automatic Corp., Macedonia, Ohio.
Peck, Sidney (J'40) (AFP), Test Inspr., Wright Aero. Corp., Paterson, N.J.; *for mail,* 354 Ocean Ave., Brooklyn, N.Y.
Pecker, Jos. S. ('19; '21; '35), Owner, Jos. S. Pecker Mch. & Tool Designing Co., 1011 Chestnut St., Philadelphia, Pa.
Pecker, Leo S. (J'41) (ACM), Jr. Engr., BG Corp., 136 W. 52nd St., New York; *for mail,* 192 E. 57th St., Brooklyn, N.Y.
Peebles, Jas. C. ('39) (FKS), Prof. Exper. Engrg., Armour College of Engrg., Ill. Inst. of Tech.; Head of Div. of Exper. Engrg., Armour Research Foundation, 3300 Federal St., Chicago, Ill.
Peebles, Thos. A. ('12) (FJS), V.P., Hagan Corp., 300 Ross St.; *for mail,* 31 Mt. Lebanon Blvd., South Hills P.O., Pittsburgh, Pa.
Peery, David J. (J'41) (ABH), Stress Analyst, Curtiss-Wright Corp., Robertson; *for mail,* 109 Thoroughman St., Ferguson, Mo.
Peet, John L. ('41) (CDM), Div. Supt. of Maint., Gary Sheet & Tin Mills, Carnegie-Ill. Steel Corp.; *for mail,* 631 Pierce St., Gary, Ind.

Peets, Wilbur J. ('14; '25), Asst. Supt., Charge Engrg., Singer Mfg. Co., Trumbull St.; *for mail,* 973 Coolidge Rd., Elizabeth, N.J.
Peff, Ivan (J'36) (CK), Asst. Mgr., Superior Air Products Co., 132 Malvern St., Newark; *for mail,* 6 Koewing Pl., West Orange, N.J.
Pegram, George B. ('28) (ABH), Prof. of Physics, Dean of Graduate Faculties, Columbia Univ., 116th St. & Broadway, New York, N.Y.
Pegram, Wm. B. (J'34) (BKS), Design Engr., Westinghouse Elec. & Mfg. Co., Lester Branch P.O., Philadelphia; *for mail,* 607 Hillborn Ave., Swarthmore, Pa.
Pei, Ching Pong ('26; '28; '32) (BFR), Research Engr., Loco. Fire Box Co., 310 S. Michigan St., Chicago, Ill.
Peickii, V. L. (J'38) (ACM), Indus. Engr., Vega Airplane Co., Lockheed Air Terminal, Burbank; *for mail,* 1140 Gower St., Hollywood, Calif.
Peiler, Karl E. ('27) (BFK), V.P., Engrg., Hartford-Empire Co., P.O. Box 1620, Hartford, Conn.
Peirce, William H. ('87), 100 W. University Pkwy., Baltimore, Md.
Peller, Leonard (J'33) (KLS), Indus. Engr., United Engrs. & Constructors, Inc., 1401 Arch St.; *for mail,* 6810 Lawnton Ave., Philadelphia, Pa.
Pelletier, Emile J. ('27; '35), Bell Aircraft Corp., 2050 Elmwood Ave., Buffalo, N.Y.
Pellett, W. H. (J'35) (CJM), Asst. Supt., Link-Belt, Ltd., 791 Eastern Ave., Toronto, Ont., Can.
Pellow, Richard A. (J'40) (ACM), Secy., Treas., Pellow Mch. Co., 13500 Foley Ave.; *for mail,* 17311 Prairie Ave., Detroit, Mich.
Pelton, Benjamin H. (J'37) (EFP), Charge Gasoline & Crude Oil Sales, Mountain Fuel Supply, Rock Springs, Wyo.
Pelton, Ernest W. ('13) (CDM), V.P., Gen. Supt., Stanley Works, Lake St.; *for mail,* 77 Forest St., New Britain, Conn.
Pelton, Philip W. (J'40) (DJM), Mech. Design Course, Gen. Elec. Co., 1 River Rd.; *for mail,* 1972 Eastern Pkwy., Schenectady, N.Y.
Pemberton, Carlysle ('12; '25; '35) (BCH), Assoc. Engr., Div. of Waterways, State of Ill., 201 W. Monroe St.; *for mail,* 607½ S. Douglas Ave., Springfield, Ill.
Pender, W. R. ('20; '35) (EFS), Supt. of Constr., A. M. Lockett & Co., Ltd., 308 Whitney Bldg., New Orleans, La.
Pendleton, Miles S. (J'32) (JMS), Engr., Pendleton Associates, Grand Cent. Terminal Bldg., New York, N.Y.
Penn, Marion ('21; '30), Gen. Mgr., Elec. Dept., Pub. Serv. Elec. & Gas Co., 80 Park Pl., Newark; *for mail,* 333 Beech Spring Rd., South Orange, N.J.
Pennebaker, Robt. H. ('31), Lub. Engr., Lion Oil Refining Co., El Dorado, Ark.
Penniman, Abbott L., Jr. ('15; '21; '32) (CFS), Gen. Supt. Elec. Operas., Consltd. Gas, Elec. Light & Power Co. of Baltimore, Lexington Bldg.; *for mail,* 1523 Bolton St., Baltimore, Md.
Penning, Cornelis J. H. ('21) (CRS), Adviser, Mysore Sugar Co., Ltd., Bangalore & Mandya, Mysore State, India; *for mail,* Stanwood, P.O. Goring, Oxon, England.
Pennington, John W. (J'39) (BCE), Caterpillar Tractor Co.; *for mail,* 511 W. McClure St., Peoria, Ill.
Penny, William F. ('41), c/o George Edel, Farmingdale Rd., W., Babylon, L.I., N.Y.
Penrose, Chas. ('18), V.P., Day & Zimmermann, Inc., Packard Bldg., Philadelphia, Pa.
Penrose, Edward T. (J'39), Draftsman, J. W. Greer Co., Cambridge; *for mail,* 30 Parker St., Islington, Mass.
Penruddocke, J. H. ('89), Retired; Ensleigh, Limpley-Stoke, Bath, England.
Penton, Paul (J'41) (ABM), Mech. Designer, Scintilla Magneto Div., Bendix Aviation; *for mail,* 26 River St., Sidney, N.Y.
Pepoon, Philip W. (J'33) (AB), Jr. Aero. Engr., Langley Memorial Aero. Lab., Natl. Advis. Com. for Aeronautics, Langley Field; *for mail,* 141 Melrose Ave., Hampton, Va.
Pepper, David T. (J'39) (BHK), Jr. Mech. Engr., U.S. Navy Yard; *for mail,* 179 Lincoln Ave., Portsmouth, N.H.
Pepper, James D. (J'41) (EJK), Lt., 13th Coast Artillery, Ft. Moultrie, Moultrieville, S.C.
